# **Apache Libcloud Documentation**

Release 3.8.0

**The Apache Software Foundation** 

# Contents

1	Docu	nentation
	1.1	Main
		1.1.1 Getting Started
		1.1.2 Supported Providers
		1.1.3 Supported Python Versions
		1.1.4 Third Party Drivers
		1.1.5 Compute
		1.1.6 Object Storage
		1.1.7 Load Balancer
		1.1.8 DNS
		1.1.9 Container
		1.1.10 Backup
		1.1.11 Troubleshooting
		1.1.12 API Documentation
		1.1.13 Frequently Asked Questions (FAQ)
		1.1.14 Registering a third party driver
		1.1.15 SSL Certificate Validation in <v2.0< td=""></v2.0<>
		1.1.16 Using an HTTP / HTTPS proxy
		1.1.17 Working with the object oriented APIs
		1.1.18 Using Libcloud in multi-threaded and async environments
	1.2	Developer Information
		1.2.1 Developer Information
		1.2.2 Development
	1.3	Committer Guide
		1.3.1 Committer Guide
	1.4	Other
		1.4.1 Changelog
		1.4.2 Upgrade Notes
		1.4.3 Security

**Note:** Libcloud v3.5.0 dropped support for Python 3.5 and now only supports Python  $\geq$  3.6.

Libcloud v3.0.0 dropped support for Python 2.7 and Python 3.4 and now only supports Python >= 3.5.

If you still need to us Libcloud with one of the now unsupported Python versions, you can do that by using an older release of Libcloud which still supports that Python version (Libcloud v3.4.x for Python 3.5 and Libcloud v2.8.x for Python 2.7 and Python 3.4).

Apache Libcloud is a Python library which hides differences between different cloud provider APIs and allows you to manage different cloud resources through a unified and easy to use API.

Resource you can manage with Libcloud are divided in the following categories:

- Cloud Servers and Block Storage services such as Amazon EC2 and Rackspace CloudServers
- Cloud Object Storage and CDN services such as Amazon S3 and Rackspace CloudFiles
- Load Balancers as a Service services such as Amazon Elastic Load Balancer
- DNS as a Service services such as Amazon Route 53 and Zerigo
- Container Services container virtualization like Docker and Rkt as well as container based services
- Backup as a Service services such as Amazon EBS and OpenStack Freezer

Contents 1

Fig. 1: A subset of supported providers in Libcloud.

2 Contents

# CHAPTER 1

**Documentation** 

# 1.1 Main

# 1.1.1 Getting Started

# Installation (stable version)

Libcloud is available on PyPi. You can install latest stable version using pip:

pip install apache-libcloud

# Installation (development version)

You can install latest development version from our Git repository:

pip install -e git+https://git.apache.org/repos/asf/libcloud.git@trunk#egg=apache- $\rightarrow$ libcloud

# **Upgrading**

If you used pip to install the library you can also use it to upgrade it:

pip install --upgrade apache-libcloud

# Using it

This section describes a standard work-flow which you follow when working with any of the Libcloud drivers.

1. Obtain reference to the provider driver

2. Instantiate the driver with your provider credentials

```
driver = cls('my username', 'my api key')
```

Keep in mind that some drivers take additional arguments such as region and api\_version.

For more information on which arguments you can pass to your provider driver, see provider-specific documentation and the driver docstrings.

3. Start using the driver

```
pprint (driver.list_sizes())
pprint (driver.list_nodes())
```

4. Putting it all together

You can find more examples with common patterns which can help you get started on the Compute Examples page.

## Where to go from here?

The best thing to do after understanding the basic driver work-flow is to visit the documentation chapter for the API you are interested in (*Compute*, *Object Storage*, *Load Balancer*, *DNS*). Chapter for each API explains some basic terminology and things you need to know to make an effective use of that API.

After you have a good grasp of those basic concepts, you are encouraged to check the driver specific documentation (if available) and usage examples. If the driver specific documentation for the provider you are interested in is not available yet, you are encouraged to check docstrings for that driver.

# 1.1.2 Supported Providers

This pages lists supported providers and methods for all the APIs.

#### Compute

Provider	Documentation	Provider Constant	Supported Regions
Abiquo		ABIQUO	single region driver
Aliyun ECS	Click	ALIYUN_ECS	single region driver
PCextreme AuroraCompute	Click	AURORACOMPUTE	single region driver
Azure Virtual machines	Click	AZURE	single region driver
Azure Virtual machines	Click	AZURE_ARM	single region driver
Brightbox		BRIGHTBOX	single region driver
Cloudscale	Click	CLOUDSCALE	single region driver
CloudSigma (API v2.0)	Click	CLOUDSIGMA	single region driver
CloudStack	Click	CLOUDSTACK	single region driver
DigitalOcean	Click	DIGITAL_OCEAN	single region driver
DimensionData	Click	DIMENSIONDATA	single region driver
Amazon EC2	Click	EC2	af-south-1, ap-east-1, ap-northeast-1, ap-northeas
EquinixMetal	Click	EQUINIXMETAL	single region driver
Eucalyptus		EUCALYPTUS	single region driver
Exoscale	Click	EXOSCALE	single region driver

# 1.1.3 Supported Python Versions

# **Currently Supported Python Versions**

Libcloud v3.5.0 and above supports CPython  $\geq$  3.6 and PyPy  $\geq$  3.6.

Those are also the versions we continuously run our tests with on Github Actions (https://travis-ci.org/apache/libcloud).

# **Python Python 3.5**

Support for CPython 3.5 was dropped in Libcloud v3.5.0.

If you still need to use Libcloud with one of those versions, you can use Libcloud v3.4.x which is the last release which supports those Python versions.

# Python 2.7 and Python 3.4

Support for CPython 2.7, CPython 3.4 and PyPy 2 was dropped in Libcloud v3.0.0.

If you still need to use Libcloud with one of those versions, you can use Libcloud v2.8.0 which is the last release which supports those Python versions.

#### **Older Python Versions**

Support for Python 2.4 has been dropped in Libcloud 0.4.0, Python 2.5 in 2016 and Python 2.6 and 3.3 in Libcloud 2.3.0 in 2018.

Keep in mind that those Libcloud versions are now very old and out of date and shouldn't be used.

# 1.1.4 Third Party Drivers

Libcloud includes most of the drivers in its core, but some providers and developers for various reasons decide to release their driver as a separate PyPi package.

This page lists those third party drivers. For documentation and usage examples, please refer to the third party driver documentation (if available).

Keep in mind that those drivers are not part of the core and such we can't guarantee the quality of those drivers.

# Compute

Provider	PyPi package	Source code
StratusLab	stratuslab-libcloud-drivers	StratusLab/libcloud-drivers
Snooze		msimonin/snooze-libcloud

# DNS

Provider	PyPi package	Source code
DNSMadeEasy	libcloud-dnsmadeeasy	moses-palmer/libcloud-dnsmadeeasy

# 1.1.5 Compute

The compute component of libcloud allows you to manage cloud and virtual servers offered by different providers, more than 20 in total.

In addition to managing the servers this component also allows you to run deployment scripts on newly created servers. Deployment or "bootstrap" scripts allow you to execute arbitrary shell commands. This functionality is usually used

to prepare your freshly created server, install your SSH key, and run a configuration management tool (such as Puppet, Chef, or cfengine) on it.

Besides managing cloud and virtual servers, compute component also allows you to manage cloud block storage (not to be confused with cloud object storage) for providers which support it. Block storage management lives under compute API, because it is in most cases tightly coupled with compute resources.

# **Terminology**

#### Compute

- Node represents a cloud or virtual server.
- NodeSize represents node hardware configuration. Usually this is amount of the available RAM, bandwidth, CPU speed and disk size. Most of the drivers also expose an hourly price (in dollars) for the Node of this size.
- NodeImage represents an operating system image.
- NodeLocation represents a physical location where a server can be.
- NodeState represents a node state. Standard states are: running, rebooting, terminated, pending, stopped, suspended, paused, erro, unknown.

#### **Key Pair Management**

• KeyPair - represents an SSH key pair object.

# **Block Storage**

- StorageVolume represents a block storage volume
- VolumeSnapshot represents a point in time snapshot of a StorageVolume

# **Supported Providers**

For a list of supported providers see supported providers page.

#### **Pricing**

For majority of the compute providers Libcloud provides estimated pricing information which tells users how much it costs per hour to run a Node with a specific NodeSize.

For more information, please see the pricing page.

## **Deployment**

Libcloud provides deployment functionality which makes bootstrapping a server easier. It allows you to create a server and run shell commands on it once the server has been created.

For more information and examples, please see the deployment page.

## SSH key pair management

Compute API also allows you to manage your SSH key pairs.

For more information and examples, please see the key pair management page.

#### **Examples**

We have examples of several common patterns.

#### **API Reference**

For a full reference of all the classes and methods exposed by the compute API, see this page.

# 1.1.6 Object Storage

**Note:** Object Storage API is available in Libcloud 0.5.0 and higher.

Storage API allows you to manage cloud object storage (not to be confused with cloud block storage) and services such as Amazon S3, Rackspace CloudFiles, Google Storage and others.

Besides managing cloud object storage, storage component also exposes simple CDN management functionality.

# **Terminology**

- Container represents a container which can contain multiple objects. You can think of it as a folder on a file system. Difference between container and a folder on file system is that containers cannot be nested. Some APIs and providers (e.g. AWS) refer to it as a Bucket.
- Object represents an object or so called BLOB.

## **Supported Providers**

For a list of supported providers see supported providers page.

# **Examples**

We have examples of several common patterns.

#### **API Reference**

For a full reference of all the classes and methods exposed by the storage API, see this page.

# 1.1.7 Load Balancer

**Note:** Load Balancer API is available in Libcloud 0.5.0 and higher.

Load Balancer API allows you to manage Load Balancers as a service and services such as Rackspace Cloud Load Balancers and Ninefold Load Balancers.

# **Terminology**

- LoadBalancer represents a load balancer instance.
- Member represents a load balancer member.
- Algorithm represents a load balancing algorithm (round-robin, random, least connections, etc.).

# **Supported Providers**

For a list of supported providers see supported providers page.

#### **Examples**

We have examples of several common patterns.

#### **API Reference**

For a full reference of all the classes and methods exposed by the loadbalancer API, see this page.

# 1.1.8 DNS

**Note:** DNS API is available in Libcloud 0.6.0 and higher.

DNS API allows you to manage DNS as A Service and services such as Zerigo DNS, Rackspace Cloud DNS and others.

# **Terminology**

- Zone Represents a DNS zone or so called domain.
- Record Represents a DNS record. Each record belongs to a Zone and has a type and data attribute. Value of the data attribute depends on the record type. Some record types also require user to associate additional attributes with them. Those additional attributes are stored in the extra attribute (dictionary) on the record object. An example include MX and SRV record type which also contains a priority.
- RecordType Represents a DNS record type (A, AAAA, MX, TXT, SRV, PTR, NS, etc.)
- **Zone Type** Each zone has a type attribute. This attribute represents a zone type. Type can either be master (also called primary) or slave (also called secondary).

#### **Supported Providers**

For a list of supported providers see supported providers page.

#### **Examples**

We have examples of several common patterns.

#### **API Reference**

For a full reference of all the classes and methods exposed by the DNS API, see this page.

# 1.1.9 Container

Note: Container API is available in Libcloud 1.0.0-pre1 and higher.

Note: Container API is currently in an EXPERIMENTAL state.

Container API allows users to install and deploy containers onto container based virtualization platforms. This is designed to target both on-premise installations of software like Docker as well as interfacing with Cloud Service Providers that offer Container-as-a-Service APIs.

For a working example of the container driver with cluster support, see the example for Amazon's Elastic Container Service:

```
from libcloud.container.base import ContainerImage
from libcloud.container.types import Provider
from libcloud.container.providers import get_driver
cls = get_driver(Provider.ECS)
conn = cls(
   access_id="SDHFISJDIFJSIDFJ",
   secret="THIS_IS) + MY_SECRET_KEY+I6TVkv6804H",
    region="ap-southeast-2",
for cluster in conn.list_clusters():
   print(cluster.name)
   if cluster.name == "default":
        container = conn.deploy_container(
            cluster=cluster,
            name="my-simple-app",
            image=ContainerImage(
                id=None, name="simple-app", path="simple-app", version=None,
→driver=conn
```

For an example of the simple container support, see the Docker example:

#### **Drivers**

Container-as-a-Service providers will implement the ContainerDriver class to provide functionality for:

- Listing deployed containers
- Starting, stopping and restarting containers (where supported)
- Destroying containers
- Creating/deploying containers
- · Listing container images
- Installing container images (pulling an image from a local copy or remote repository)

Driver base API documentation is found here:

• ContainerDriver - A driver for interfacing to a container provider

#### Simple Container Support

- ContainerImage Represents an image that can be deployed, like an application or an operating system
- Container Represents a deployed container image running on a container host

# **Cluster Suppport**

Cluster support extends on the basic driver functions, but where drivers implement the class-level attribute *sup-ports\_clusters* as True clusters may be listed, created and destroyed. When containers are deployed, the target cluster can be specified.

- ContainerCluster Represents a deployed container image running on a container host
- ClusterLocation Represents a location for clusters to be deployed

# **Bootstrapping Docker with Compute Drivers**

The compute and container drivers can be combined using the deployment feature of the compute driver to bootstrap an installation of a container virtualization provider like Docker. Then using the Container driver, you can connect to that API and install images and deploy containers.

#### **Supported Providers**

For a list of supported providers see supported providers page.

# **Examples**

We have examples of several common patterns.

#### **API Reference**

For a full reference of all the classes and methods exposed by the Container API, see this page.

#### **Utility Classes**

There are some utility classes for example, a Docker Hub API client for fetching images and iterating through repositories see this page.

# 1.1.10 Backup

**Note:** Backup API is available in Libcloud 1.0.0-pre1 and higher.

**Note:** This driver is **experimental** - please use to test functionality and develop new driver instances, not for production use.

Backup API allows you to manage Backup as A Service and services such as EBS Snaps, GCE volume snap and dimension data backup.

# **Terminology**

- BackupTarget Represents a backup target, like a Virtual Machine, a folder or a database.
- BackupTargetRecoveryPoint Represents a copy of the data in the target, a recovery point can be recovered to a backup target. An inplace restore is where you recover to the same target and an out-of-place restore is where you recover to another target.
- BackupTargetJob Represents a backup job running on backup target.

#### **Supported Providers**

For a list of supported providers see supported providers page.

#### **Examples**

We have examples of several common patterns.

#### **API Reference**

For a full reference of all the classes and methods exposed by the Backup API, see this page.

# 1.1.11 Troubleshooting

This page contains various tips which can help you troubleshoot and debug code with interfaces with libcloud.

#### **Debugging**

**Note:** If you are sharing debug output on any public medium such as our IRC channel or an issue tracker using Pastebin, Github Gists or a similar service, make sure to remove your credentials and any other data you consider private from the output.

Libcloud has a special debug mode which when enabled, logs all the outgoing HTTP requests and all the incoming HTTP responses. Output also includes cURL commands which can be used to re-produce the requests.

When this mode is enabled and paramiko library is installed (used for deployment), paramiko library log level is set to DEBUG which helps with debugging the deployment related issues.

To make the debugging easier, Libcloud will also automatically decompress the response body (if compressed) before logging it.

To enable it, set LIBCLOUD\_DEBUG environment variable and make it point to a file where the debug output should be saved.

If the API returns JSON or XML in the response body which is not human friendly, you can also set LIBCLOUD\_DEBUG\_PRETTY\_PRINT\_RESPONSE environment variable which will cause the JSON or XML to be beautified / formated so it's easier for humans to read it. Keep in mind that this only works for non-chunked responses.

# Example 1 - Logging output to standard error

**Note:** Some Linux distributions don't allow /dev/{stderr,stdout} to be opened in append mode which means paramiko logger will return and error that it can't log to that file. In such scenario, it's recommended you specify actual file path and then you can use "tail -F" in another terminal window to view the output in real-time.

If you want the output to be logged to the standard error (on Linux) you can set it to /dev/stderr:

```
LIBCLOUD_DEBUG=/dev/stderr python my_script.py
```

#### Example output:

(continues on next page)

#### Example 2 - Making JSON / XML response human friendly

#### Non-formatted JSON response:

```
LIBCLOUD_DEBUG=/dev/stderr python my_script.py
```

```

#### 1.1.12 API Documentation

For automatically generated API documentation of all the modules, please visit this page.

# 1.1.13 Frequently Asked Questions (FAQ)

#### Why are the block storage related management methods located in the compute API?

Block storage related management methods are located in the compute API because in most cases block storage API is tightly coupled with the compute API meaning that you can't manage block storage independent of the compute API

This also makes sense because in most cases you are only interested in attaching or detaching volumes from and to the compute nodes.

#### What are the extension methods and arguments?

Libcloud acts as a lowest common denominator and exposes a unified base API which allows you to work with many different cloud providers through a single code base.

Being a lowest common denominator by definition means that not all of the functionality offered by different cloud service providers is available through a base API.

Libcloud solves this problem and allows user to access provider specific functionality through a so called extension methods and arguments. Extension methods and arguments are all the methods and arguments which are prefixed with ex\_.

Extension methods are there for your convenience, but you should be careful when you use them because they make switching or working with multiple providers harder.

## How do I test if provider credentials are valid?

Libcloud makes the whole authentication process transparent to the user. As such, the easiest way to check if provider credentials are valid is by instantiating a driver and calling a method which results in an HTTP call.

If the credentials are valid, method will return a result, otherwise libcloud.common.types. InvalidCredsError exception will be thrown.

An example of such method is libcloud.compute.base.NodeDriver.list\_nodes(). Keep in mind that depending on the account state, list\_nodes method might return a lot of data.

If you want to avoid unnecessarily fetching a lot of data, you should find a method specific to your provider which issues a request which results in small amount of data being retrieved.

# I want do add a new provider driver what should I do?

For now the best thing to do is to look at an existing driver and test cases for examples.

Libcloud currently supports more than 60 different providers. This means we have a broad range of examples of different APIs and authentication methods. APIs range from simple JSON based REST APIs to SOAP APIs. Authentication methods range from simple shared token and digest auth to HMAC signed requests.

#### I want to add / propose a new API, what should I do?

We are always open to accepting a now top level API as long as it matches the following criteria:

- 1. API must be indented to manage an online infrastructure oriented Cloud service
- 2. Similar service is offered by multiple providers
- 3. It's possible to build a common API on top of services provided by different services

Libcloud can be used with many different providers and acts as a lowest common denominator which makes the last point most important one. Sometimes it doesn't make sense to build a common Libcloud API even if multiple providers offer a similar service. Usually the case is that the APIs are vastly different and there aren't enough common points which would allow us to build a cross-provider API which would still provide enough value to the end user.

If the API matches the criteria defined above, you should send a proposal to our *mailing list* where we can discuss it further. Ideally, the proposal should also contain a prototype of a driver for at least two different providers. This helps us make sure that the API you have designed is not biased towards a single provider.

## How do I obtain Libcloud version?

You can obtain currently active Libcloud version by accessing the libcloud. version variable.

Example #1 (command line):

```
python -c "import libcloud; print libcloud.__version__"
```

Example #2 (code):

```
import libcloud
libcloud.__version__
```

# 1.1.14 Registering a third party driver

Driver is considered third party if it's not bundled with a Libcloud release.

To register a third party driver you should use provider.set\_driver() function from the corresponding component.

set\_driver() takes the following arguments:

```
set_driver('provider_name', 'path.to.the.module', 'DriverClass')
```

Keep in mind that the *provider\_name* needs to be unique and this function needs to be called before using a third party driver.

For example:

```
from libcloud.compute.providers import get_driver, set_driver
set_driver("stratuslab", "stratuslab.libcloud.stratuslab_driver",
    "StratusLabNodeDriver")

# Your code which uses the driver.
# For example:
driver = get_driver("stratuslab")
```

An example of an existing third party driver can be found at https://github.com/StratusLab/libcloud-drivers

#### 1.1.15 SSL Certificate Validation in <v2.0

When establishing a secure connection to a cloud provider endpoint, Libcloud verifies server SSL certificate. By default, Libcloud searches paths listed in libcloud.security.CA\_CERTS\_PATH variable for the CA certificate files.

CA\_CERTS\_PATH contains common paths to CA bundle installations on the following platforms:

- certifi package on PyPi
- openssl package on CentOS / Fedora
- ca-certificates package on Debian / Ubuntu / Arch / Gentoo
- ca\_root\_nss port on FreeBSD
- curl-ca-bundle port on Mac OS X
- openssl and curl-ca-bundle homebrew package

If no valid CA certificate files are found, you will see an error message similar to the one below:

```
No CA Certificates were found in CA_CERTS_PATH.
```

The easiest way to resolve this issue is to install *certifi* Python package from PyPi using pip. This package provides curated collection of Root Certificates based on the Mozilla CA bundle. If this package is installed and available, Libcloud will use CA bundle which is bundled by default.

As the list of trusted CA certificates can and does change, you are also encouraged to periodically update this package (pip install --upgrade certifi or similar).

If for some reason you want to avoid this behavior, you can set LIBCLOUD\_SSL\_USE\_CERTIFI environment variable to false. Or even, better provide a direct path to the CA bundle you want to use using SSL\_CERT\_FILE environment variable as shown below.

### **Windows Users**

The CA loading system does not load the Windows Certificate store, since this is not a directory. Windows users should download the following file and place in a directory like %APPDATA%libcloud or somewhere easily accessible. https://raw.githubusercontent.com/bagder/ca-bundle/master/ca-bundle.crt

Then configure this file using one of the 2 methods in *Using a custom CA certificate* 

# **Acquiring CA Certificates**

If the above packages are unavailable to you, and you don't wish to roll your own, the makers of cURL provides an excellent resource, generated from Mozilla: http://curl.haxx.se/docs/caextract.html.

### Using a custom CA certificate

If you want to use a custom CA certificate file for validating the server certificate, you can do that using two different approaches:

1. Setting SSL\_CERT\_FILE environment variable to point to your CA file

```
SSL_CERT_FILE=/home/user/path-to-your-ca-file.crt python my_script.py
```

2. Setting libcloud.security.CA\_CERTS\_PATH variable in your script to point to your CA file

```
import libcloud.security
libcloud.security.CA_CERTS_PATH = ['/home/user/path-to-your-ca-file.crt']
# Instantiate and work with the driver here...
```

# Adding additional CA certificate to the path

If you want to add an additional CA certificate to the CA\_CERTS\_PATH, you can do this by appending a path to your CA file to the libcloud.security.CA\_CERTS\_PATH list.

For example:

```
import libcloud.security
libcloud.security.CA_CERTS_PATH.append('/home/user/path-to-your-ca-file.crt')
# Instantiate and work with the driver here...
```

### **Disabling SSL certificate validation**

**Note:** Disabling SSL certificate validations makes you vulnerable to MITM attacks so you are strongly discouraged from doing that. You should only disable it if you are aware of the consequences and you know what you are doing.

To disable SSL certificate validation, set libcloud.security.VERIFY\_SSL\_CERT variable to False at the top of your script, before instantiating a driver and interacting with other Libcloud code.

For example:

1.1. Main 33

```
import libcloud.security
libcloud.security.VERIFY_SSL_CERT = False
# Instantiate and work with the driver here...
```

# 1.1.16 Using an HTTP / HTTPS proxy

#### Note:

- 1. Support for HTTP proxies is available in Libcloud v0.16.0 and higher.
- 2. Support for HTTPS proxies is available in Libcloud v2.5.1-dev and higher.
- 3. In versions prior to v2.5.1-dev, driver.connection.set\_http\_proxy() method is broken and you need to use driver.connection.connection.set\_http\_proxy() instead.

Libcloud supports using an HTTP / HTTPS proxy for outgoing HTTP and HTTPS requests.

Proxy support has been tested with the following Python versions:

- Python 2.7 / PyPy
- Python 3.4
- Python 3.6
- Python 3.7

You can specify which HTTP(s) proxy to use using one of the approaches described below:

- By setting http\_proxy / https\_proxy environment variable (this setting is system / process wide)
- By passing http\_proxy argument to the libcloud.common.base.LibcloudConnection class constructor (this setting is local to the connection instance)
- By calling libcloud.common.base.LibcloudConnection.set\_http\_proxy() method aka driver.connection.connection.set\_http\_proxy(this setting is local to the connection instance)

### **Known limitations**

- · Only HTTP basic access authentication proxy authorization method is supported
- If you are using HTTPS proxy you need to configure Libcloud to use CA cert bundle path which is used by the proxy server. See an example below on how to do that.

# **Examples**

This section includes some code examples which show how to use an HTTP(s) proxy with Libcloud.

# 1. Using http\_proxy / htps\_proxy environment variable

By setting http\_proxy / https\_proxy environment variable you can specify which proxy to use for all of the outgoing requests for a duration / life-time of the process or a script.

Without authentication (http proxy):

```
http_proxy=http://<proxy hostname>:<proxy port> python my_script.py
```

### Without authentication (https proxy):

```
http_proxy=https://cproxy hostname>:cproxy port> python my_script.py
# or
https_proxy=https://cproxy hostname>:cproxy port> python my_script.py
```

#### With basic auth authentication (http proxy):

```
http_proxy=http://<username>:<password>@<proxy hostname>:<proxy port> python my_

→script.py
```

### 2. Passing proxy\_url argument to the connection class constructor

#### . note:

```
Some drivers don't correctly pass ``proxy_url`` argument to the connection class and don't support ``proxy_url`` constructor argument.

If you pass this argument to the driver constructor, but it doesn't appear to be working, it's likely the driver doesn't support this method.

In such scenarios, you are advised to use some other method of setting a proxy (e.g. by setting an environment variable or by using :meth:`libcloud.common.base.LibcloudConnection.set_http_proxy` method).
```

By passing proxy\_url argument to the libcloud.common.base.Connection class constructor, you can specify which proxy to use for a particular connection.

```
from libcloud.compute.types import Provider
from libcloud.compute.providers import get_driver

HTTP_PROXY_URL_NO_AUTH_1 = "http://
HTTPS_PROXY_URL_NO_AUTH_1 = "https://
HTTPS_PROXY_URL_NO_AUTH_1 = "https://
cls = get_driver(Provider.RACKSPACE)

# 1. Use http proxy
driver = cls("username", "api key", region="ord", proxy_url=HTTP_PROXY_URL_NO_AUTH_1)

# 2. Use https proxy
driver = cls("username", "api key", region="ord", proxy_url=HTTPS_PROXY_URL_NO_AUTH_1)
```

### 3. Calling set\_http\_proxy method

Calling set\_http\_proxy method allows you to specify which proxy to use for all the outgoing requests which follow set\_http\_proxy method call.

This method also allows you to use a different proxy for each request as shown in the example below.

```
from pprint import pprint
from libcloud.compute.types import Provider
```

(continues on next page)

1.1. Main 35

(continued from previous page)

```
from libcloud.compute.providers import get_driver

HTTP_PROXY_URL_NO_AUTH_1 = "http://
HTTP_PROXY_URL_NO_AUTH_2 = "http://
HTTP_PROXY_URL_NO_AUTH_2 = "http://
HTTP_PROXY_URL_BASIC_AUTH = "http://<user>:
cls = get_driver(Provider.RACKSPACE)
driver = cls("username", "api key", region="ord")

# Use proxy 1 for this request
driver.connection.connection.set_http_proxy(proxy_url=HTTP_PROXY_URL_NO_AUTH_1)
pprint(driver.list_nodes())

# Use proxy 2 for this request
driver.connection.connection.set_http_proxy(proxy_url=HTTP_PROXY_URL_NO_AUTH_2)
pprint(driver.list_nodes())
```

### 4. Using an HTTPS proxy

This example shows how to use an HTTPS proxy.

To use an HTTPS proxy, you also need to configure Libcloud to use CA cert bundle which is used by the HTTPS proxy server, to verify outgoing https request. If you don't do that, you will see errors similar to the one below:

```
SSLError(1, u'[SSL: CERTIFICATE_VERIFY_FAILED] certificate verify failed
```

Keep in mind that you will also receive a similar error message if you try to use HTTP proxy for HTTPS requests.

# 1.1.17 Working with the object oriented APIs

To make it easier for the end user, Libcloud components expose a fully object-oriented API.

This means that besides the driver object you also work with NodeImage, and NodeSize object in the compute API, Container and Object object in the Storage API, Zone and Record object in the DNS API and so on.

Methods which operate on those resources usually require you to pass in an instance of the resource you want to manipulate or work with and not just an id.

To obtain a reference to this resource, Libcloud providers corresponding get and / or list methods.

A couple of examples are shown below.

### Example 1 - listing records for a zone with a known id

```
from libcloud.dns.types import Provider
from libcloud.dns.providers import get_driver

CREDENTIALS_ZERIGO = ("email", "api key")
ZONE_ID = "example.myzone.com"

Cls = get_driver(Provider.ZERIGO)
driver = Cls(*CREDENTIALS_ZERIGO)

zone = driver.get_zone(zone_id=ZONE_ID)
records = driver.list_records(zone=zone)
```

In this example, the driver.get\_zone() method call results in an HTTP call.

### Example 2 - creating an EC2 instance with a known NodeSize and NodeImage id

```
from libcloud.compute.types import Provider
from libcloud.compute.providers import get_driver

ACCESS_ID = "your access id"
SECRET_KEY = "your secret key"

IMAGE_ID = "ami-c8052d8d"
SIZE_ID = "t1.micro"

cls = get_driver(Provider.EC2)
driver = cls(ACCESS_ID, SECRET_KEY, region="us-west-1")

# Here we select size and image
sizes = driver.list_sizes()
images = driver.list_images()

size = [s for s in sizes if s.id == SIZE_ID][0]
image = [i for i in images if i.id == IMAGE_ID][0]
node = driver.create_node(name="test-node", image=image, size=size)
```

In this example, both the driver.list\_sizes() and driver.list\_images() method calls result in HTTP calls.

As you can see above, most of those getter methods retrieve extra information about the resource from the provider API and result in an HTTP request.

There are some cases when you might not want this:

- You don't care if a resource doesn't exist
- You don't care about the extra attributes

1.1. Main 37

- You want to avoid an extra HTTP request
- You want to avoid holding a reference to the resource object

If that is true for you, you can directly instantiate a resource with a known id. You can see how to do this in the examples below.

### Example 1 - listing records for a zone with a known id

```
from libcloud.dns.base import Zone
from libcloud.dns.types import Provider
from libcloud.dns.providers import get_driver

CREDENTIALS_ZERIGO = ("email", "api key")
ZONE_ID = "example.myzone.com"

Cls = get_driver(Provider.ZERIGO)
driver = Cls(*CREDENTIALS_ZERIGO)

zone = Zone(ZONE_ID, domain=None, type=None, ttl=None, driver=driver)
records = driver.list_records(zone=zone)
```

### Example 2 - creating an EC2 instance with a known NodeSize and NodeImage id

```
from libcloud.compute.base import NodeSize, NodeImage
from libcloud.compute.types import Provider
from libcloud.compute.providers import get_driver
ACCESS ID = "your access id"
SECRET_KEY = "your secret key"
IMAGE_ID = "ami-c8052d8d"
SIZE_ID = "t1.micro"
cls = get driver(Provider.EC2)
driver = cls(ACCESS_ID, SECRET_KEY, region="us-west-1")
size = NodeSize(
   id=SIZE_ID,
   name=None,
   ram=None,
   disk=None,
   bandwidth=None,
   price=None,
   driver=driver,
image = NodeImage(id=IMAGE_ID, name=None, driver=driver)
node = driver.create_node(name="test-node", image=image, size=size)
```

### Example 3 - creating an EC2 instance with an IAM profile

```
from libcloud.compute.types import Provider
from libcloud.compute.providers import get_driver
ACCESS_ID = "your access id"
SECRET_KEY = "your secret key"
IAM_PROFILE = "your IAM profile arm or IAM profile name"
IMAGE_ID = "ami-c8052d8d"
SIZE_ID = "t1.micro"
cls = get_driver(Provider.EC2)
driver = cls(ACCESS_ID, SECRET_KEY, region="us-west-1")
# Here we select size and image
sizes = driver.list_sizes()
images = driver.list_images()
size = [s for s in sizes if s.id == SIZE_ID][0]
image = [i for i in images if i.id == IMAGE_ID][0]
node = driver.create_node(name="test-node", image=image, size=size, ex_iamprofile=IAM_
→PROFILE)
```

# 1.1.18 Using Libcloud in multi-threaded and async environments

Libcloud's primary task is to communicate with different provider APIs using HTTP. This means most of the work is not CPU intensive, but performing all those HTTP requests includes a lot of waiting which makes the library I/O bound.

Most of the time you want to perform more operations in parallel or just want your code to finish faster (for example starting a lot of servers or periodically polling for node status).

Problems like this are usually solved using threads or async libraries such as Twisted, Tornado or gevent.

This page contains some information and tips about how to use Libcloud in such environments.

# Libcloud and thread-safety

Important thing to keep in mind when dealing with threads is thread-safety. Libcloud driver instance is **not** thread safe. This means if you don't want to deal with complex (and usually inefficient) locking the easiest solution is to create a new driver instance inside each thread.

### Using Libcloud with gevent

gevent has an ability to monkey patch and replace functions in the Python socket, urllib2, httplib and time module with its own functions which don't block.

You need to do two things when you want to use Libcloud with gevent:

• Enable monkey patching

```
from gevent import monkey
monkey.patch_all()
```

 Create a separate driver instance for each Greenlet. This is necessary because a driver instance reuses the same Connection class.

1.1. Main 39

For an example see Efficiently download multiple files using gevent.

# **Using Libcloud with Twisted**

Libcloud has no Twisted support included in the core which means you need to be careful when you use it with Twisted and some other async frameworks.

If you don't use it properly it can block the whole reactor (similar as any other blocking library or a long CPU-intensive task) which means the execution of other pending tasks in the event queue will be blocked.

A simple solution to prevent blocking the reactor is to run Libcloud calls inside a thread. In Twisted this can be achieved using threads.deferToThread which runs a provided method inside the Twisted thread pool.

The example below demonstrates how to create a new node inside a thread without blocking the whole reactor.

```
from pprint import pprint
# pylint: disable=import-error
from twisted.internet import defer, reactor, threads
from libcloud.compute.types import Provider
from libcloud.compute.providers import get_driver
@defer.inlineCallbacks
def create_node(name):
   node = yield threads.deferToThread(_thread_create_node, name=name)
   pprint (node)
   reactor.stop()
def _thread_create_node(name):
   Driver = get_driver(Provider.RACKSPACE)
   conn = Driver("username", "api key")
   image = conn.list_images()[0]
   size = conn.list_sizes()[0]
   node = conn.create_node(name=name, image=image, size=size)
   return node
def stop(*args, **kwargs):
   reactor.stop()
d = create_node(name="my-lc-node")
d.addCallback(stop) # pylint: disable=no-member
d.addErrback(stop) # pylint: disable=no-member
reactor.run()
```

# 1.2 Developer Information

# 1.2.1 Developer Information

## **Type Annotations**

Python type annotations / hints for the base Libcloud compute API have been added in v2.8.0.

The goal behind type annotations is to make developer lives easier by introducing optional static typing for Python programs.

This allows you to catch bugs and issues which are related to variable types earlier and faster (aka when you run mypy locally either manually or integrated in your editor / IDE and also as part of you CI/CD build pipeline).

An example of how to use type annotations correctly is shown below.

```
# Licensed to the Apache Software Foundation (ASF) under one or more
# contributor license agreements. See the NOTICE file distributed with
# this work for additional information regarding copyright ownership.
# The ASF licenses this file to You under the Apache License, Version 2.0
# (the "License"); you may not use this file except in compliance with
# the License. You may obtain a copy of the License at
      http://www.apache.org/licenses/LICENSE-2.0
# Unless required by applicable law or agreed to in writing, software
# distributed under the License is distributed on an "AS IS" BASIS,
# WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied.
# See the License for the specific language governing permissions and
# limitations under the License.
from typing import Type, cast
from libcloud.compute.types import Provider
from libcloud.compute.providers import get_driver
from libcloud.compute.drivers.ec2 import EC2NodeDriver
from libcloud.compute.drivers.rackspace import RackspaceNodeDriver
ec2_cls = get_driver(Provider.EC2)
rackspace_cls = get_driver(Provider.RACKSPACE)
# NOTE: If you are using driver methods which are not part of the standard API,
# you need to explicitly cast the driver class reference to the correct class
# for type checking to work correctly
EC2 = cast(Type[EC2NodeDriver], ec2_cls)
Rackspace = cast(Type[RackspaceNodeDriver], rackspace_cls)
drivers = [
   EC2("access key id", "secret key", region="us-east-1"),
   Rackspace("username", "api key", region="iad"),
1
nodes = []
for driver in drivers:
    nodes.extend(driver.list_nodes())
print (nodes)
# [ <Node: provider=Amazon, status=RUNNING, name=bob, ip=1.2.3.4.5>,
# <Node: provider=Rackspace, status=REBOOT, name=korine, ip=6.7.8.9.10>, ... ]
# grab the node named "test"
node = [n for n in nodes if n.name == "test"][0]
```

(continues on next page)

(continued from previous page)

```
# reboot "test"
node.reboot()
```

If you reference an invalid object attribute or a method, you would see an error similar to the one beloe when running mypy:

```
print (nodes[0].name)
print (nodes[0].invalid)
print (nodes[0].rebbot())
print (nodes[0].reboot (foo='invalid'))
...
```

```
$ mypy --no-incremental example_compute.py
example_compute.py:41: error: "Node" has no attribute "invalid"
example_compute.py:42: error: "Node" has no attribute "rebbot"; maybe "reboot"?
example_compute.py:43: error: Unexpected keyword argument "foo" for "reboot" of "Node"
```

If you are using driver methods which are not part of the Libcloud standard API, you need to use cast () method as shown below to cast the driver class to the correct type. If you don't do that, mypy will only be aware of the methods which are part of the Libcloud base compute API (aka BaseNodeDriver class).

This is needed because of how Libcloud utilizes meta programming for the get\_driver() and related methods (there is no other way without writing a mypy plugin to achieve that).

### **Mailing Lists**

All of the communication about Libcloud development happens on our mailing lists.

- announce@libcloud.apache.org Moderated and low volume mailing list which is only used for distributing important project announcements and updates. (announce-archive)
- users@libcloud.apache.org Mailing list for general talk about Libcloud and other off-topic things (users-archive)
- dev@libcloud.apache.org General mailing list for developers (dev-archive)
- notifications@libcloud.apache.org Commits messages and other automatically generated notifications go to
  this mailing list. Keep in mind that unlike the others, this mailing list is fairly noisy. (notifications-archive,
  commits-archive)

Archive of old incubator mailing lists:

- · incubator-libcloud
- incubator-libcloud-commits

#### **IRC**

• #libcloud on Libera.chat (https://libera.chat)

#### **Issue Tracker**

For bug and issue tracking we use Github issues located at https://github.com/apache/libcloud/issues.

## **Testing**

For information how to run the tests and how to generate the test coverage report, please see the Testing page.

# **Continuous Integration**

For continuous integration we use Travis-CI. You can find build reports on the following links:

• https://travis-ci.org/apache/libcloud

Travis-CI builder is also integrated with Github which means that if you open a pull request there, Travis-CI will automatically build it.

If you want to validate the build before raising the PR, Travis-CI can be enabled for personal accounts and branches separately.

### **Test Coverage**

Test coverage report is automatically generated after every push and can be found at https://codecov.io/github/apache/libcloud?branch=trunk.

# 1.2.2 Development

This page describes Libcloud development process and contains general guidelines and information on how to contribute to the project.

# Contributing

We welcome contributions of any kind (ideas, code, tests, documentation, examples, ...).

If you need help or get stuck at any point during this process, stop by on our IRC channel (#libcloud on freenode) and we will do our best to assist you.

### Getting started with contributing to Libcloud

### General contribution guidelines

- Any non-trivial change must contain tests. For more information, refer to the Testing page.
- All the functions and methods must contain Sphinx docstrings which are used to generate the API documentation. For more information, refer to the *Docstring conventions* section below.
- If you are adding a new feature, make sure to add a corresponding documentation.

# Code style guide

- We follow The Black code style and automatically enforce it for all the new code using black tool. You can re-format your code using black by running black tox target (tox -eblack).
- We enforce consistent import ordering using the isort library. Imports can be automatically re-ordered / sorted by using isort tox target (tox -e isort).
- Use 4 spaces for a tab

- Use 100 characters in a line
- · Make sure edited file doesn't contain any trailing whitespace
- Make sure new code contains type annotations
- You can verify that your changes don't break any rules by running the following tox targets lint, pylint, black tox -elint, pylint, black, isort.

And most importantly, follow the existing style in the file you are editing and be consistent.

### Git pre-commit hook

To make complying with our style guide easier, we provide a git pre-commit hook which automatically checks modified Python files for violations of our style guide.

You can install it by running following command in the root of the repository checkout:

```
ln -s contrib/pre-commit.sh .git/hooks/pre-commit
```

After you have installed this hook it will automatically check modified Python files for violations before a commit. If a violation is found, commit will be aborted.

### **Code conventions**

This section describes some general code conventions you should follow when writing a Libcloud code.

#### 1. Import ordering

Organize the imports in the following order:

- 1. Standard library imports
- 2. Third-party library imports
- 3. Local library (Libcloud) imports

Each section should be separated with a blank line. For example:

```
import sys
import base64

import paramiko

from libcloud.compute.base import Node, NodeDriver
from libcloud.compute.providers import Provider
```

#### 2. Function and method ordering

Functions in a module and methods on a class should be organized in the following order:

- 1. "Public" functions / methods
- 2. "Private" functions / methods (methods prefixed with an underscore)
- 3. "Internal" methods (methods prefixed and suffixed with a double underscore)

For example:

```
class Unicorn(object):
    def __init__(self, name='fluffy'):
        self._name = name

    def make_a_rainbow(self):
        pass

    def __get_rainbow_colors(self):
        pass

    def __eq__(self, other):
        return self.name == other.name
```

Methods on a driver class should be organized in the following order:

- 1. Methods which are part of the standard API
- 2. Extension methods
- 3. "Private" methods (methods prefixed with an underscore)
- 4. "Internal" methods (methods prefixed and suffixed with a double underscore)

Methods which perform a similar functionality should be grouped together and defined one after another.

For example:

```
class MyDriver(object):
    def __init__(self):
        pass
    def list_nodes(self):
        pass
   def list_images(self):
        pass
    def create_node(self):
        pass
    def reboot_node(self):
        pass
    def ex_create_image(self):
        pass
    def _to_nodes(self):
        pass
    def _to_node(self):
        pass
    def _to_images(self):
        pass
    def _to_image(self):
        pass
```

Methods should be ordered this way for the consistency reasons and to make reading and following the generated API documentation easier.

## 3. Prefer keyword over regular arguments

For better readability and understanding of the code, prefer keyword over regular arguments.

Good:

```
some_method(public_ips=public_ips, private_ips=private_ips)
```

Bad:

```
some_method(public_ips, private_ips)
```

#### 4. Don't abuse \*\*kwargs

You should always explicitly declare arguments in a function or a method signature and only use \*\*kwargs and \*args respectively when there is a valid use case for it.

Using \*\*kwargs in many contexts is against Python's "explicit is better than implicit" mantra and makes it for a bad and a confusing API. On top of that, it makes many useful things such as programmatic API introspection hard or impossible.

A use case when it might be valid to use \*\*kwargs is a decorator.

Good:

```
def my_method(self, name, description=None, public_ips=None):
    pass
```

Bad (please avoid):

```
def my_method(self, name, **kwargs):
    description = kwargs.get('description', None)
    public_ips = kwargs.get('public_ips', None)
```

# 5. When returning a dictionary, document its structure

Dynamic nature of Python can be very nice and useful, but if (ab)use it in a wrong way it can also make it hard for the API consumer to understand what is going on and what kind of values are being returned.

If you have a function or a method which returns a dictionary, make sure to explicitly document in the docstring which keys the returned dictionary contains.

### 6. Prefer to use "is not None" when checking if a variable is provided or defined

When checking if a variable is provided or defined, prefer to use if foo is not None instead of if foo.

If you use if foo approach, it's easy to make a mistake when a valid value can also be falsy (e.g. a number 0).

For example:

```
class SomeClass(object):
    def some_method(self, domain=None):
        params = {}
```

(continues on next page)

(continued from previous page)

```
if domain is not None:
    params['Domain'] = domain
```

### **Docstring conventions**

For documenting the API we we use Sphinx and reStructuredText syntax. Docstring conventions to which you should adhere to are described below.

- Doestrings should always be used to describe the purpose of methods, functions, classes, and modules.
- Method docstring should describe all the normal and keyword arguments. You should describe all the available arguments even if you use \*args and \*\*kwargs.
- All parameters must be documented using :param p: or :keyword p: and :type p: annotation.
- :param p: ... A description of the parameter p for a function or method.
- : keyword p: ... A description of the keyword parameter p.
- : type p: ... The expected type of the parameter p.
- Return values must be documented using :return: and :rtype annotation.
- :return: ... A description of return value for a function or method.
- :rtype: ... The type of the return value for a function or method.
- Required keyword arguments must contain (required) notation in description. For example: :keyword image: OS Image to boot on node. (required)
- Multiple types are separated with or For example: :type auth: :class:`.NodeAuthSSHKey` or :class:`.NodeAuthPassword`
- For a description of the container types use the following notation: <container\_type> of <objects\_type>. For example: :rtype: `list` of :class:`Node`

For more information and examples, please refer to the following links:

- Sphinx Documentation http://sphinx-doc.org/markup/desc.html#info-field-lists
- Example Libcloud module with documentation https://github.com/apache/libcloud/blob/trunk/libcloud/compute/base.py

# Updating compute node sizing data

Node sizing data for most providers is stored in-line as a module level constant in the corresponding provide module.

An exception to that is AWS EC2 which sizing data is automatically generated and scraped from AWS API as documented below.

#### Updating EC2 sizing and supported regions data

To update EC2 sizing data, you just need to run scrape-ec2-sizes tox target and commit the changed files (libcloud/compute/constants/ec2\_instance\_types.py, libcloud/compute/constants/ec2\_region\_details\_complete.py).

To add a new region update <code>contrib/scrape-ec2-prices.py</code> and <code>contrib/scrape-ec2-sizes.py</code> file (example https://github.com/apache/libcloud/commit/762f0e5623b6f9837204ffe27d825b236c9c9970) and then re-run corresponding tox targets as shown below:

tox -escrape-ec2-sizes, scrape-ec2-prices

### Updating compute node pricing data

Pricing data for some provides is automatically scraped using scrape-and-publish-provider-prices tox target (this target required valid AWS and Google Cloud API keys to be set for it to work).

This tox target is ran before making a new release which means that each release includes pricing data which has been updated on the day of the release.

In addition to that, that tox target runs daily as part of our CI/CD system and the latest version of that file is published to a public read-only S3 bucket.

For more information on how to utilize that pricing data, please see Pricing page.

#### Contribution workflow

### 1. Start a discussion on our Github repository or on the mailing list

If you are implementing a big feature or a change, start a discussion on the issue tracker or the mailing list first.

# 2. Open a new issue on our issue tracker

Go to our issue tracker and open a new issue for your changes there. This issue will be used as an umbrella place for your changes. As such, it will be used to track progress and discuss implementation details.

### 3. Fork our Github repository

Fork our Github git repository. Your fork will be used to hold your changes.

# 4. Create a new branch for your changes

### For example:

git checkout -b <change\_name>

#### 5. Make your changes

### 6. Write tests for your changes and make sure all the tests pass

Make sure that all the code you have added or modified has appropriate test coverage. Also make sure all the tests including the existing ones still pass.

Use libcloud.test.unittest as the unit testing package to ensure that your tests work with older versions of Python.

For more information on how to write and run tests, please see Testing page.

## 7. Commit your changes

Commit your changes.

For example:

git commit -m "Add a new compute driver for CloudStack based providers."

### 8. Open a pull request with your changes

Go to https://github.com/apache/libcloud/ and open a new pull request with your changes. Your pull request will appear at https://github.com/apache/libcloud/pulls.

#### 9. Wait for the review

Wait for your changes to be reviewed and address any outstanding comments.

# **Contributing Bigger Changes**

If you are contributing a bigger change (e.g. large new feature or a new provider driver) you need to have signed Apache Individual Contributor License Agreement (ICLA) in order to have your patch accepted.

You can find more information on how to sign and file an ICLA on the Apache website.

When filling the form, leave field preferred Apache id(s) empty and in the notify project field, enter Libcloud.

# **Supporting Multiple Python Versions**

Libcloud supports a variety of Python versions so your code also needs to work with all the supported versions. This means that in some cases you will need to include extra code to make sure it works in all the supported versions.

Some examples which show how to handle those cases are described below.

#### **Context Managers**

Context managers aren't available in Python 2.5 by default. If you want to use them make sure to put from \_\_future\_\_ import with\_statement on top of the file where you use them.

### Utility functions for cross-version compatibility

You can find a lot of utility functions which make code easier to work with Python 2.x and 3.x in libcloud.utils.py3 module.

You can find some more information on changes which are involved in making the code work with multiple versions on the following link - Lessons learned while porting Libcloud to Python 3

# 1.3 Committer Guide

### 1.3.1 Committer Guide

# New committer guidelines

**Note:** This section outlines steps which need to be completed by new team members and is indented for people who have been voted to join Libcloud project as a committer and / or PMC member. It also assumes you have already filled your ICLA and your Apache account has been created.

First congratulations and welcome to the team!

#### 1. Subscribe to the public mailing lists

If you haven't yet, subscribe to {dev,users,notifications}@libcloud.apache.org mailing lists. Notifications mailing list is especially important because all of Github Issue, Pull Request and build notifications are sent there.

### 2. Subscribe to the private mailing list

Subscribe to private@libcloud.apache.org by sending an email to private-subscribe@libcloud.apache.org. Keep in mind that this list is private and your subscription needs to be approved by a moderator.

### 3. Create PyPi account

Creating a PyPi account by going to https://pypi.python.org/pypi?%3Aaction=register\_form and send an email to private@libcloud.apache.org requesting to be added as a maintainer to apache-libcloud package. Make sure to select a strong and unique password (pwgen -s 48 1 is your friend).

After you have registered go to "Your details" page and populate PGP Key ID field with your PGP key ID.

# 4. Link your ASF and Github account

We use Github for managing issues and user contributions (pull requests). As such, you need to link your Github.com account with your ASF account using Gitbox. This way you will get write access to github.com/apache/libcloud repository and you will be able to manage issues and pull request directly through our Github repository.

### Merging user contributions

When a pull request with user contribution (changes) has been reviewed and all the criteria for merging has been met (tests and code coverage, Travis build is passing, user signed an ICLA, etc.), you can directly merge those changes into trunk either by using Github web interface or doing it manually on the command line.

It's also important that you update changelog in CHANGES.rst file after you merged the changes.

# Making a release (for release managers)

This section contains information a release manager should follow when preparing a release.

### 0. Update committed files

- Make sure CHANGES file is up to date
- Make sure \_\_version\_\_ string in libcloud/\_\_init\_\_.py is up to date
- Make sure version and release in docs/conf.py are up to date
- Update constants, pricing and other auto-generated data: tox -e scrape-ec2-sizes, scrape-ec2-prices

#### 1. Pre-release check list

- Make sure tests pass on all the supported Python versions (tox)
- Remove the tox directory with rm -rf .tox
- Remove the \_secrets\_ file with rm libcloud/test/secrets.py
- Remove leftover builds from previous releases. rm -f dist/apache\*; rm -rf apache\_libcloud.egg-info

# 2. Update Github

- Create a new Github milestone for the release in question (if one doesn't exist yet)
- · Update affected issues and pull requests and add the corresponding release milestone to them

# 3. Creating release artifacts

**Note:** It's important that you have the latest versions of build package installed to ensure the generated wheel files contain correct metadata.

We have a script that runs the required commands and then hashes and signs the files. You will need the latest version of build package.

To run it:

```
# Install build dependencies
pip install -e ".[build]"

cd dist
./release.sh -u <yourusername>@apache.org
```

-u argument will be used to find a key with a matching email address in your local GPG database.

This should result in a set of apache-libcloud-\${VERSION}.{tar.gz,whl}{,asc,md5,sha1} files that are suitable to be uploaded for a release.

Copy the artifacts in another directory, unpack one of them and test it with tox.

1.3. Committer Guide 51

## 4. Tagging a release

Tag the tentative release with a -tentative postfix.

```
git tag <version> <commit hash>
```

#### For example:

```
git tag --sign v0.15.0-tentative 105b9610835f99704996d861d613c5a9a8b3f8b1
```

# 5. Upload the release artifacts and start a [VOTE] thread

Upload all release artifacts including the whl files to your people.apache.org space. Then start a [VOTE] thread on the dev@libcloud.apache.org mailing list.

Once the vote has passed tag the release with a new tag, removing the -tentative postfix. Upload the release artifacts to Apache servers and Pypi.

For example:

```
git tag --sign v0.15.0 105b9610835f99704996d861d613c5a9a8b3f8b1
```

The commit SHA needs to be the one release artifacts are based on (aka the one people voted on) and the same one you used for the -tentative tag.

Keep in mind that it's important that you sign the commit / tag with your GPG key.

# 6. Uploading release artifacts to Apache servers

- Add release artifacts to the dist SVN repository at https://dist.apache.org/repos/dist/release/libcloud/
   It may take up to a day for the artifacts to be available on all the Apache mirrors, but they should be instantly available at http://www.apache.org/dist/libcloud/.
- If there is more than one old release in the repository, delete rest of the old release and only leave current and
  previous release there. Old releases are automatically archived and available at https://dist.apache.org/repos/
  dist/release/libcloud/.

### 7. Publishing package to PyPi

We have a script that runs uploads the signed Python source files to PyPi. It uses twine, so ensure you have twine available in your path *which twine* before running. Twine can be downloaded from https://pypi.python.org/pypi/twine

```
# Install publish dependencies
pip install -e ".[publish]"

cd dist
./deploy.sh
```

Once all the files have been uploaded, the page should look similar to the screenshot below.

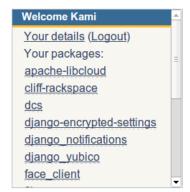

» Package Index > apache-libcloud > 0.13.1

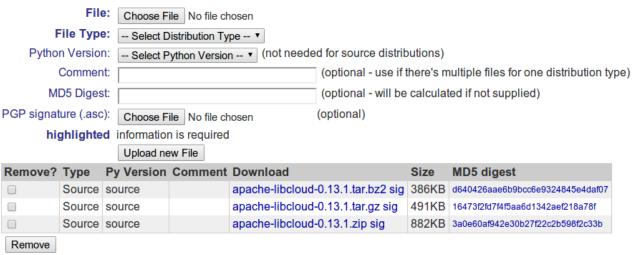

# Files for apache-libcloud 0.13.1

Package: roles | releases | view | edit | files | urls | PKG-INFO

To upload files to this index, you have two options:

- 1. Use the setup.py "upload" command.
- 2. Or enter the information manually:

#### 8. Verifying the release artifact check sums

To verify that nothing went wrong doing the release process, run the ./dist/verify\_checksums.sh script.

This script downloads the release artifacts from the Apache and PyPi server and makes sure that the MD5 check sums of the both files match.

Usage:

```
./dist/verify_checksums.sh <version>
```

### For example

```
./dist/verify_checksums.sh apache-libcloud-3.5.0
```

### Updating doap\_libcloud.rdf, \_\_init\_\_.py

Add information about the new release to the doap\_libcloud.rdf file in the root of the main code repository.

Update \_\_version\_\_ attribute in libcloud/\_\_init.py\_\_ file and indicate we are now working on a new release by incrementing a number and adding -dev suffix. For example, if version 2.2.1 has been released you would change it from:

1.3. Committer Guide 53

```
__version__ = '2.2.1'

To:
```

```
__version__ = '2.2.2-dev'
```

# 10. Updating website

Check out the website using git: git clone http://gitbox.apache.org/repos/asf/libcloud-site.git

- Update the front page (source/index.html file)
- Update "Downloads" page (source/downloads.md file)
- Add a blog entry in the \_posts directory.

Build the site locally and make sure everything is correct before pushing website updated. Check the README.md file in that repo on how to do that.

### 11. Sending announcements

- Send a release announcement to {dev,users}@libcloud.apache.org. If it's a major release also send it to announce@apache.org.
- Send a release announcement to Twitter and Google+

Note: If the release fixes a security vulnerability, you should also send information about a vulnerability to the following full disclosure mailing lists:

- full-disclosure@lists.grok.org.uk
- bugtraq@securityfocus.com

The email you send should also be signed using your GPG key. You can find an example of such announcement on the following url.

If needed, use Apache URL shortening service - http://s.apache.org/

### Mailing list email templates

This section includes email templates which can be used when sending out official communication to the mailing lists.

### Release voting thread template

This template should be used when starting a voting thread for a new release.

Subject:

```
[VOTE] Release Apache Libcloud <version>
```

Body:

### For example:

#### Subject:

```
[VOTE] Release Apache Libcloud 0.13.2
```

#### Body:

```
This is a voting thread for Libcloud 0.13.2.
This is another primarily a bug-fix release. Previous release included a fix for the
→Content-Length bug which didn't fully fix the original issue. It missed out "raw".
→requests which are fixed in this release (LIBCLOUD-396).
This bug could manifest itself while uploading a file with some of the storage_
⇒providers.
Besides this bug fix, it includes a couple of other smaller bug fixes and changes...
→Full change log
can be found at https://git.apache.org/repos/asf?p=libcloud.git;a=blob;f=CHANGES;
→h=b7747f777afdeb63bcacf496d1d034f1b3287c31;
→hb=c4b3daae946049652a500a8515929b4cbf14a6b4
Release artifacts can be found at http://people.apache.org/~tomaz/libcloud/.
Please test the release and post your votes.
+/- 1
[ ] Release Apache Libcloud 0.13.2
Vote will be opened until September 18th, 2013 (or longer, if needed).
Thanks.
Tomaz
```

1.3. Committer Guide 55

#### Release announcement

This template should be used when sending out a release announcement.

Subject:

```
[ANNOUNCE] Apache Libcloud 0.13.1 release
```

#### Body:

```
Libcloud is a Python library that abstracts away the differences among
multiple cloud provider APIs. It allows users to manage cloud services
(servers, storage, loadbalancers, DNS) offered by many different providers
through a single, unified and easy to use API.
We are pleased to announce the release of Libcloud <version>!
<short description of the release which should include release highlights>
Full change log can be found at <link to CHANGES file for this release>
Download
Libcloud <version> can be downloaded from http://libcloud.apache.org/downloads.html
or installed using pip:
pip install apache-libcloud
Upgrading
If you have installed Libcloud using pip you can also use it to upgrade it:
pip install --upgrade apache-libcloud
Upgrade notes
A page which describes backward incompatible or semi-incompatible
changes and how to preserve the old behavior when this is possible
can be found at http://libcloud.apache.org/upgrade-notes.html.
Documentation
API documentation can be found at http://libcloud.apache.org/apidocs/<version>/.
We also have a new Sphinx documentation which can be found at https://libcloud.apache.
→org/docs/.
Bugs / Issues
If you find any bug or issue, please report it on our issue tracker
<https://github.com/apache/libcloud/issues>.
Don't forget to attach an example and / or test which reproduces your problem.
Thanks
Thanks to everyone who contributed and made this release possible! Full list of
people who contributed to this release can be found in the CHANGES file
k to the changes file for this release>.
```

### For example:

#### Subject:

```
[ANNOUNCE] Apache Libcloud 0.13.1 release
```

#### Body:

```
Libcloud is a Python library that abstracts away the differences among
multiple cloud provider APIs. It allows users to manage cloud services
(servers, storage, loadbalancers, DNS) offered by many different providers
through a single, unified and easy to use API.
We are pleased to announce the release of Libcloud 0.13.1!
This is a bug-fix only release. Among some smaller bugs it also fixes
Content-Length regression which broke create and update operations in
the Bluebox Compute and Azure Storage driver (LIBCLOUD-362, LIBCLOUD-3901).
Full change log can be found at <a href="https://git.apache.org/repos/asf?p=libcloud.git">https://git.apache.org/repos/asf?p=libcloud.git</a>;
→a=blob; f=CHANGES; h=ca90c84e296ca82e2206eb86ed7364c588aad503;
→hb=602b6a7a27dca6990a38eb887e1d6615826387d5>
Download
Libcloud 0.13.1 can be downloaded from http://libcloud.apache.org/downloads.html
or installed using pip:
pip install apache-libcloud
Upgrading
If you have installed Libcloud using pip you can also use it to upgrade it:
pip install --upgrade apache-libcloud
Upgrade notes
A page which describes backward incompatible or semi-incompatible
changes and how to preserve the old behavior when this is possible
can be found at http://libcloud.apache.org/upgrade-notes.html.
Documentation
API documentation can be found at http://libcloud.apache.org/apidocs/0.13.1/.
We also have a new Sphinx documentation which can be found at https://libcloud.apache.
→org/docs/.
Keep in mind though, that this documentation reflects state in trunk which
includes some backward incompatible changes which aren't present in 0.13.1.
All the examples in the documentation which only work with trunk are clearly marked.
\rightarrowwith a note.
Bugs / Issues
If you find any bug or issue, please report it on our issue tracker
<https://github.com/apache/libcloud/issues>.
Don't forget to attach an example and / or test which reproduces your problem.
                                                                            (continues on next page)
```

1.3. Committer Guide 57

(continued from previous page)

#### Thanks

Thanks to everyone who contributed and made this release possible! Full list of people who contributed to this release can be found in the CHANGES file <a href="https://git.apache.org/repos/asf?p=libcloud.git;a=blob;f=CHANGES;">h+ca90c84e296ca82e2206eb86ed7364c588aad503;</a>

 $\rightarrow$ hb=602b6a7a27dca6990a38eb887e1d6615826387d5>.

# 1.4 Other

# 1.4.1 Changelog

### Changes in Apache Libcloud 3.8.0

### Compute

• Remove obsolete compute driver where the provider is either dead or not offering those services anymore: Bluebox, bsnlcloud, Cloudwatt, Enomaly, ElasticHosts, ElasticStack, GoGrid, Gridspot, HostVirtual, Joyent, Med-1, Nephoscale, 1on1, ProfitBricks, ServerLove, SkaliCloud, Softlayer, Voxel.

(GITHUB-1743, GITHUB-1852) [Anthony Monthe - @ZuluPro, Tomaz Muraus - @Kami]

- [Outscale] Fix list\_nodes() and list\_volumes() method. (GITHUB-1877) [Matthias Gatto @outscale-mgo]
- [Azure ARM] Implement pagination in the list\_nodes() method. This fixes a bug which would result in sometimes not all the nodes being returned. (GITHUB-1824, GITHUB-1850) [Jan Müller @ojan-mue]
- [Azure ARM] Implement pagination in the list\_volumes() method. This fixes a bug which would result in sometimes not all the volumes nodes being returned. (GITHUB-1891) [Jan Müller @ojan-mue]
- [Azure ARM] Bump DISK\_API\_VERSION from 2018-06-01 to 2023-01-02 to support premium v2 SSDs. (GITHUB-1904) [John Wren Kennedy @jwk404]
- [AWS EC2] Add support for the following new arguments to the ex\_register\_image() method: \* boot\_mode control bios vs uefi boot \* tpm\_support enable a tpm \* uefi\_data provide NV UEFI vars \* imds\_support require IMDSv2. (GITHUB-1906) [Ross Vandegrift @rvandegrift]

### **Storage**

• Optimize read\_in\_chunks() function implementation.

This should result in large performance speedups and lower memory usage when uploading or downloading a large file with a mismatching chunk size.

Keep in mind that this only affects code paths where the function is called with fill\_size=True argument (such as in the S3 driver, etc). (GITHUB-1847) [Tobias Biester - @Tobi995]

- [Aliyun OSS] Fix upload\_object() function. (GITHUB-1796) [@shengwubin]
- [S3] Support all available storage classes. Previously only "standard" and "reduced\_redundancy" were supported. (GITHUB-1875) [Mohammad Aburadeh @mohammad-aburadeh]

- [CloudFiles] Fix get\_endpoint\_url() throwing an exception when being used with use\_internal\_url=True argument. (GITHUB-1883, GITHUB-1884) [Marcus T @llamasoft]
- [CloudFiles] Update OpenStack connection handling code to only re-connect in case connection details (scheme, host, port) have changed.
  - This should result in significant performance improvements when downloading objects since the underlying HTTP connection will be properly re-used. (GITHUB-1885, GITHUB-1886) [Marcus T @llamasoft]
- [Backblaze B2] Fix a bug which would result in an exception when passing extra={ "meta\_data": {}} argument to the upload\_object() method. (GITHUB-1916) [Shepilov Vladislav @shepilov-vladislav]

#### Other

- Move Python tooling (pytest, bandit, pylint, mypy, coverage) config options from separate config files into single pyproject.yaml config files.
  - NOTE: This change only affects development process and nothing else. (GITHUB-1901) [RS Nikhil Krishna @rsnk96]
- Fix minor typos in the code using codespell package and enforce this check as part of our GHA CI system. (GITHUB-1923) [Tomaz Muraus @Kami]
- Indicate we also support Python 3.12 (beta). (GITHUB-1920) [Tomaz Muraus @Kami]
- Remove unused libcloud.security.SSL\_VERSION constant / module level variable. This variable has been unused and had no affect on the behavior since we switched to the requests library for making HTTP(s) requests in 2016. [Tomaz Muraus @Kami]
- Packaging related metadata has been migrated from setup.py to pyproject.yaml file. (GITHUB-1929) [Tomaz Muraus @Kami]
- Deprecated and unsafe setup.py test convenience alias for running tests using pytest has been removed in favor of running pytest directly. (GITHUB-1929) [Tomaz Muraus @Kami]
- Script for building release artifacts has been updated to utilize build Python package to build release artifacts (sdist + wheel) in an isolated environment. (GITHUB-1929) [Tomaz Muraus @Kami]

#### Changes in Apache Libcloud 3.7.0

#### Common

• Support for Python 3.6 which has been EOL for more than a year now has been removed.

If you still want to use Libcloud with Python 3.6, you should use an older release which still supports Python 3.6. (GITHUB-1611)

### Compute

- [CloudSigma] Update API URLs for US locations. (GITHUB-1781) [Mohsen Hassani @mohsen-hassani-cs]
- [GCP] Fix OAuth2 desktop client login. (GITHUB-1806, GITHUB-1807) [Veith Röthlingshöfer @RunOrVeith]

1.4. Other 59

## **Storage**

• [Amazon S3] Add support for af-south-1 region. (GITHUB-1821) [@alier350]

### Other

• Also run unit tests under Python 3.11 on CI/CD and indicate we also support Python 3.11. (GITHUB-1818)

### Changes in Apache Libcloud 3.6.1

#### Common

• [OpenStack] Fix OpenStack Identity bug when auth url contains a path.

```
(GITHUB-1717, GITHUB-1718) [Dimitris Galanis - @dimgal1]
```

• Update EC2 price scraping script to utilize official pricing API endpoint.

Pricing file has also been updated to include latest EC2 pricing data.

Complete raw pricing data file size has grown by ~1 MB (from ~2 MB to ~3 MB).

By default when requesting pricing data we only cache pricing data in memory for used / requested drivers so a slight memory increase due to the pricing file size increase will only affect users who utilize pricing related functionality in the EC2 driver.

```
(GITHUB-1715) [Eis D. Zaster - @Eis-D-Z]
```

### Compute

• [EC2] Update list\_images() method to better handle scenario when an image doesn't contain creationDate attribute (previously the code would throw if an image without creationDate was encountered).

Reported by Juan Marcos Caicedo Mejía - @juanmarcosdev.

```
(GITHUB-1700, GITHUB-1701) [Tomaz Muraus - @Kami]
```

• [Azure ARM] Allow user to create volume / disks in specific zone by passing ex\_zones argument to the create\_volume() method.

Also add new ex\_sku\_name and remove ex\_account\_type argument from that method.

Also change DISK\_API\_VERSION version from 2016-04-30-preview to 2018-06-01. This is needed to be able to support those changes. Code has been updated to handle slightly different response format for the volume API operations.

```
(GITHUB-1736) [Palash Gandhi - @palashgandhi]
```

• [GCE] Add improved support for retrieving GCE image pricing data using libcloud.pricing. get\_image\_price("gce\_images", ...) method.

Existing way of retrieving image pricing using libcloud.pricing.get\_pricing("compute", "gce\_images") method continues to work.

```
(GITHUB-1699) [Eis D. Zaster - @Eis-D-Z]
```

• [Azure ARM] Add new ex\_create\_additional\_capabilities() method which allows user to set capabilities on a stopped node. This allows users to utilize ultra SSDs and similar.

Also add support for new ex\_iops and ex\_throughput argument to the create\_volume() method.

(GITHUB-1744) [John Wren Kennedy - @jwk404]

### **Storage**

• [Azure Blobs] Fix get\_container() method and make sure Container etag extra attribute contains the correct scheme (https or http), depending on the used endpoint.

```
(GITHUB-1703, GITHUB-1712) [@KatiRG]
```

• [Azure Blobs] Fix *list\_containers()* 'method and make sure Container etag extra attribute doesn't contain unncessary double quotes around the value ("0x8CFBAB7B5B82D8E" -> 0x8CFBAB7B5B82D8E).

```
(GITHUB-1712) [Tomaz Muraus - @Kami]
```

• [OVH] Add new driver for OVH Storage based on the S3 compatible storage endpoints.

```
(GITHUB-1732) [Olivier Picquenot - @pcqnt]
```

#### Other / Development ~~~~

• All the imports in the code have been re-organized / sorted using the isort library.

Going forward, consistent import ordering will be automatically enforced using isort check on the CI.

Developers can run the isort check locally using tox -e <isort|isort-check>command.

```
(GITHUB-1761) [Tomaz Muraus - @Kami]
```

• Fix black config (pyproject.toml) and ensure max line length is correctly set to 100 characters everywhere.

Also re-format code with this fixed / updated config option.

```
(GITHUB-1761) [Tomaz Muraus - @Kami]
```

• Code has been reformatted using pyupgrade and Python 3.6 higher compatible syntax.

```
(GITHUB-1765) [Tomaz Muraus - @Kami]
```

# **Changes in Apache Libcloud 3.6.0**

#### Compute

• [OpenStack] Fix error attaching/detaching a Floating IP to an OpenStack node when *ex\_force\_microversion* is set with 2.44 or newer microversion.

```
(GITHUB-1674) [Miguel Caballer - @micafer]
```

• [OpenStack] Error in volume api calls if microversion is set in OpenStack. In previous version if *ex\_force\_microversion* is set, it is assumed to set it to the compute service. Now if only a version is set 2.67, compute service is assumed but it can be also set the service name *volume 3.21*.

```
(GITHUB-1675) [Miguel Caballer - @micafer]
```

• [OpenStack] Fix error creating and getting node in OpenStack when ex\_force\_microversion is set to a version newer than 2.47.

```
(GITHUB-1672) [Miguel Caballer - @micafer]
```

1.4. Other 61

- [EC2] Add support for new af-south-1 region. (GITHUB-1688) [Balazs Baranyi @balazsbaranyi]
- [SSH] Update deploy node and ParamikoSSHClient related code so it works with paramiko >= 2.9.0 and older OpenSSH server versions which doesn't support SHA-2 variants of RSA key verification algorithm.

paramiko v2.9.0 introduced a change to prefer SHA-2 variants of RSA key verification algorithm. With this version paramiko would fail to connect to older OpenSSH servers which don't support this algorithm (e.g. default setup on Ubuntu 14.04) and throw authentication error.

The code has been updated to be backward compatible. It first tries to connect to the server using default preferred algorithm values and in case this fails, it will fall back to the old approach with SHA-2 variants disabled.

This functionality can be disabled by setting LIBCLOUD\_PARAMIKO\_SHA2\_BACKWARD\_COMPATIBILITY``environmen variable to ``false.

For security reasons (to prevent possible downgrade attacks and similar) you are encouraged to do that in case you know you won't be connecting to any old OpenSSH servers. [Tomaz Muraus]

# **Storage**

• [Google Storage] Fix public objects retrieval. In some scenarios, Google doesn't return etag header in the response (e.g. for gzip content encoding). The code has been updated to take this into account and not throw if the header is not present.

(GITHUB-1682, GITHUB-1683) [Veith Röthlingshöfer - @RunOrVeith]

[Azure Blobs] Add support for authenticating with Azure AD by passing auth\_type="azureAd" argument
to the driver constructor.

(GITHUB-1663) [Brooke White - @brookewhite9]

#### **DNS**

• [GoDaddy] Fix list\_zones() method so it doesn't throw if an item is missing expires attribute. (GITHUB-1681) [Dave Grenier - @livegrenier]

#### Container

• [Kubernetes] Various improvements in the driver - implement list methods for nodes, services, deployments, node/pod metrics, add more fields to Pods and Containers, rename clusters to namespaces, add type annotations.

(GITHUB-1667) [Dimitris Galanis - @dimgal1]

#### Other

• Test code has been updated to utilize stdlib unittest.mock module instead of 3rd party PyPi mock package. (GITHUG-1684) Reported by @pgajdos.

## Changes in Apache Libcloud 3.5.1

#### Common

• Update code which retries failed HTTP requests to also retry failed "raw" requests and make sure we also wrap and retry piece of code where Response class is instantiated and exceptions can be thrown. [Daniel Draper - @Germandrummer92] (GITHUB-1592)

### Compute

• [GCE] Retrieve regions and zones lazily when they are first accessed (via self.zone\_{dict,list} and self.region\_{dict,list} attribute) instead of retrieving them inside the driver constructor.

(GITHUB-1661, GITHUB-1661) [Dimitris Galanis - @dimgal1]

## Changes in Apache Libcloud 3.5.0

#### Common

- Support for Python 3.5 which has been EOL for more than a year now has been removed.
  - If you still want to use Libcloud with Python 3.5, you should use an older release which still supports Python 3.5. (GITHUB-1620)
- Update AWS error response parsing code so it also correctly handles error XML responses without a namespace in the response body.

In some scenarios AWS returns error response without the namespace in the body and previous version of the code didn't handle that scenario. [Tomaz Muraus - @Kami]

### Compute

- [EC2] Add support for new ap-east-1 region. (GITHUB-1628) [Arturo Noha @r2ronoha, Tomaz Muraus @Kami]
- [OpenStack] Add Server Groups functions in OpenStack driver. (GITHUB-1629) [Miguel Caballer @micafer]
- [OpenStack] OpenStack: Move floating IP functions to use network service instead of nova.
  - This change affects all the floating ip related functions of the <code>OpenStack\_2\_NodeDriver</code> class. Two new classes have been added <code>OpenStack\_2\_FloatingIpPool</code> and <code>OpenStack\_2\_FloatingIpAddress</code>. The main change applies to the FloatingIP class where <code>node\_id</code> property cannot be directly obtained from FloatingIP information and it must be gotten from the related Port information with the <code>get\_node\_id</code> method. (GITHUB-1638) [Miguel Caballer @micafer]
- [OpenStack] Avoid raising exception if ip is not found. (GITHUB-1595) [Miguel Caballer @micafer]
- [Azure ARM] Add option to create node from Compute Gallery image. (GITHUB-1643) [Robert Harris @rgharris]
- [Azure ARM] Add create node OS disk delete option. (GITHUB-1644) [Robert Harris @rgharris]
- [EC2] Add missing creation date NodeImage extra. (GITHUB-1641) [Thomas JOUANNOT @mazerty]

1.4. Other 63

- [GCE] Allow credentials argument which is provided to the driver constructor to also be either a Python dictionary with the credentials object or a JSON string with the serialized credentials object. That's in addition to supporting passing in path to the credentials file or string PEM version of the key. (GITHUB-1214) [@bverschueren]
- [OpenStack] Personality field in the server requests of OpenStack must be optional (GITHUB-1649) [Miguel Caballer @micafer]
- [OpenStack] headers field are overwrited in case of POST of PUT methods in OpenStack connection (GITHUB-1650) [Miguel Caballer @micafer]
- [EC2] Update supported EC2 regions and instance sizes and add support for eu-south-1 region. (GITHUB-1656) [Arturo Noha @r2ronoha]
- [OpenStack] Add new ex\_force\_microversion constructor argument with which user can specify which micro version to use ( https://docs.openstack.org/api-guide/compute/microversions.html). (GITHUB-1647, GITHUB-1648)
- [GCE] Add paginated\_request() method to GCEConnection and update ex\_list\_project\_images() method to utilize it. (GITHUB-1646, GITHUB-1655) [Miguel Caballer @micafer]
- [OpenStack] Fix regression which was inadvertently introduced in #1557 which would cause some OpenStack authentication methods to not work and result in an exception.

Reported by @LanderOtto via #1659. (GITHUB-1659, GITHUB-1660) [Tomaz Muraus - @Kami]

## **Storage**

• [Local Storage] Fix object name prefix based filtering in the list\_container\_objects() method.

A change in the previous release inadvertently introduced a regression which changed the behavior so the object name prefix based filtering didn't work correctly in all the scenarios.

Reported by @louis-van-der-stam. (GITHUB-1631) [Tomaz Muraus - @Kami]

• [Local Storage] Objects returned by the list\_container\_objects() method are now returned sorted in the ascending order based on the object name.

Previously the order was arbitrary and not stable and consistent across different environments and runs.

(GITHUB-1631) [Tomaz Muraus - @Kami]

• [Scaleway] Add new driver for the Scaleway Object Storage. (GITHUB-1633) [@reixd]

### Other

- Also run unit tests under Python 3.10 + Pyjion on CI/CD. (GITHUB-1626)
- All the code has been reformatted using black v21.10b0 and we will enforce black code style for all the new code going forward.

Developers can re-format their code using new black tox target (black -etox) and they can check if there are any violations by running black-check target (tox -eblack-check). (GITHUB-1623, GITHUB-1624)

## Changes in Apache Libcloud 3.4.1

Note: Libcloud depends on the requests library for performing HTTP(s) requests.

Prior to requests v2.26.0, requests depended on chardet library which is licensed under LGPL (requests library itself is licensed under the Apache License 2.0 license).

Since Libcloud is not an application, but a library which is usually used along many other libraries in the same (virtual) environment, we can't have a strict dependency on requests >= 2.26.0 since that would break a lot of installations where users already depend on and have an older version of requests installed.

If you are using requests < 2.26.0 along the Libcloud library you are using version of chardet library (chardet is a direct dependency of the requests library) which license is not compatible with Apache Libcloud.

If using a LGPL dependency is a problem for your application, you should ensure you are using requests >= 2.26.0.

It's also worth noting that Apache Libcloud doesn't bundle any 3rd party dependencies with our release artifacts - we only provide source code artifacts on our website.

When installing Libcloud from PyPi using pip, pip will also download and use the latest version of requests without the problematic chardet dependency, unless you already have older version of the requests library installed in the same environment where you also want to use Libcloud - in that case, Libcloud will use the dependency which is already available and installed.

#### Common

• Fix a regression which was inadvertently introduced in v3.4.0 which prevented users from installing Libcloud under Python 3.5.

Also revert requests minimum version required change and relax the minimum version requirement.

Previous change would prevent Libcloud from being installed in environments where a conflicting (lower) version of requests library is required and already installed.

As a library and not an application, Libcloud should specify as loose requirements as possible to prevent issues with conflicting requirements versions which could prevent Libcloud from being installed. (GITHUB-1594)

### Changes in Apache Libcloud 3.4.0

#### Common

• Fix how we set HTTP request timeout on the underlying requests session object. requests library has changed how timeout is set so our old code had no affect.

(GITHUB-1575, GITHUB-1576) [Dimitris Galanis - @dimgal1]

- Update setup.py metadata and indicate we also support Python 3.10.
- [Google] Update Google authentication code so so we don't try to contact GCE metadata server when determining auth credentials type when oAuth 2.0 / installed app type of credentials are used.

(GITHUB-1591, GITHUB-1621)

Reported by Veith Röthlingshöfer - @RunOrVeith.

1.4. Other 65

• [Google] Update Google authentication code so we don't try to retry failed request when trying to determine if GCE metadata server is available when retrying is enabled globally (either via module level constant or via environment variable value).

This will speed up scenarios when trying is enabled globally, but GCE metadata server is not available and different type of credentials are used (e.g. oAuth 2).

```
(GITHUB-1591, GITHUB-1621)
```

Reported by Veith Röthlingshöfer - @RunOrVeith.

• Update minimum requests version we require as part for install\_requires in setup.py to 2.26.0 when using Python >= 3.6.

This was done to avoid licensing issue with transitive dependency (chardet).

NOTE: requests >=2.25.1 will be used when using Python 3.5 since 2.26.0 doesn't support Python 3.5 anymore.

For more context, see https://github.com/psf/requests/pull/5797. (GITHUB-1594)

Reported by Jarek Potiuk - @potiuk.

• Update HTTP connection and request retry code to be more flexible so user can specify and utilize custom retry logic which can be configured via connection retryCls attribute (driver.connection.retryCls = MyRetryClass).

```
(GITHUB-1558) [Veith Röthlingshöfer - @RunOrVeith]
```

• HTTP connection and request retry logic has been updated so we still respect timeout argument when retrying requests due to rate limit being reached errors. Previously, we would try to retry indefinitely on RateLimitReachedError exceptions.

### **Storage**

• [Azure Blobs] Respect Content-Encoding, Content-Language and Cache-Control headers when uploading blobs via stream.

```
Reported by Veith Röthlingshöfer - @RunOrVeith. (GITHUB-1550)
```

• [Azure Blobs] Enable the Azure storage driver to be used with Azure Government, Azure China, and Azure Private Link by setting the driver host argument to the endpoint suffix for the environment.

```
Reported by Melissa Kersh - @mkcello96 (GITHUB-1551)
```

• [Local Storage] Optimize iterate\_container\_objects method to perform early filtering if prefix argument is provided. (GITHUB-1584) [@Ido-Levi]

### Compute

• [Equinix Metal] Various improvements to the driver.

```
(GITHUB-1548) [Dimitris Galanis - @dimgal1]
```

• [OpenStack] Fix error getting non existing description of Ports.

```
(GITHUB-1543) [Miguel Caballer - @micafer]
```

- [Outscale] Various updates to the driver. (GITHUB-1549) [Tio Gobin @tgn-outscale]
- [Ovh] Fix driver so it doesn't throw if a node is in resizing state. (GITHUB-1555) [Rob Juffermans @robjuffermans]

• [OpenStack] Support volume v3 API endpoint in OpenStack driver.

```
(GITHUB-1561) [Miguel Caballer - @micafer]
```

• [GCE] Get accelerators field in the GCE machineType.

```
(GITHUB-1565) [Miguel Caballer - @micafer]
```

- [OpenStack] Support updating allowed\_address\_pairs on OpenStack ports using ex\_update\_port method. (GITHUB-1569) [@dpeschman]
- [OpenStack] Enable to get Volume Quota details in OpenStack driver.

```
(GITHUB-1586) [Miguel Caballer - @micafer]
```

• [OpenStack] Add disabled property to OpenStack images.

```
(GITHUB-1615) [Miguel Caballer - @micafer]
```

• [CloudSigma] Various updates, improvements and new functionality in the driver (support for new regions, instance types, additional standard API an extension methods, etc.).

```
(GITHUB-1558) [Dimitris Galanis - @dimgal1]
```

- [OpenStack] Add binding:host\_id value to the OpenStack port information. (GITHUB-1492) [Miguel Caballer @micafer]
- [EC2] Add support for gp3 and io2 volume types. Also add ex\_throughput argument to the create\_volume method. (GITHUB-1596) [Palash Gandhi @palashgandhi]
- [OpenStack] Add support for authenticating using application credentials. (GITHUB-1597, GITHUB-1598) [Daniela Bauer @marianne013]
- [OpenStack] Add support for using optional external cache for auth tokens

This cache can be shared by multiple processes which results in much less tokens being allocated when many different instances / processes are utilizing the same set of credentials.

This functionality can be used by implementing a custom cache class with caching logic (e.g. storing cache context on a local filesystem, external system such as Redis or similar) + using ex\_auth\_cache driver constructor argument. (GITHUB-1460, GITHUB-1557) [@dpeschman]

• [Vultr] Implement support for Vultr API v2 and update driver to use v2 by default. (GITHUB-1609, GITHUB-1610) [Dimitris Galanis - @dimgal1]

### **DNS**

- [CloudFlare] Enable authentication via API Tokens. [Clemens Wolff @c-w]
- [DigitalOcean] Fix create\_record() and update\_record() method and pass None instead of string value null for priority, port and weight parameters if they are not provided as method arguments. (GITHUB-1570) [Gasper Vozel @karantan]
- [NSOne] Fix MX records and root domain handling. (GITHUB-1571) [Gasper Vozel @karantan]
- [Vultr] Implement support for Vultr API v2 and update driver to use v2 by default. (GITHUB-1609, GITHUB-1610) [Dimitris Galanis @dimgal1]

### Other

• Fix python requires setup.py metadata item value. (GITHUB-1606) [Michał Górny - @mgorny]

1.4. Other 67

• Update tox targets for unit tests to utilize pytest-xdist plugin to run tests in parallel in multiple processes to speed up the test runs. (GITHUB-1625)

### Changes in Apache Libcloud 3.3.1

### Compute

• [EC2] Fix a regression introduced in v3.3.0 which would break EC2 driver for some regions because the driver would incorrectly try to use signature version 2 for all the regions whereas some newer regions require signature version 4 to be used.

If you are unable to upgrade, you can use the following workaround, as long as you only use code which supports / works with authentication signature algorithm version 4:

```
import libcloud.common.aws
libcloud.common.aws.DEFAULT_SIGNATURE_VERSION = "4"
# Instantiate affected driver here...
```

Reported by @olegrtecno. (GITHUB-1545, GITHUB-1546)

• [EC2] Allow user to override which signature algorithm version is used for authentication by passing signature\_version keyword argument to the EC2 driver constructor. (GITHUB-1546)

# **Storage**

• [Google Cloud Storage] Fix a bug and make sure we also correctly handle scenario in get\_object() method when the object size is returned in x-goog-stored-content-length and not content-length header.

Reported by Veith Röthlingshöfer - @RunOrVeith. (GITHUB-1544, GITHUB-1547)

• [Google Cloud Storage] Update get\_object() method and ensure object.size attribute is an integer and not a string. This way it's consistent with list\_objects() method. (GITHUB-1547)

#### Changes in Apache Libcloud 3.3.0

#### Common

- Fix a bug which would cause some prepared requests with empty bodies to be chunked which would cause some of the provider APIs such as OpenStack to return HTTP 400 errors. (GITHUB-1487, GITHUB-1488) [Michael Spagon @mspagon]
- Optimize various code imports (remove unnecessary imports, make some lazy, etc.), so now importing most of the modules is around ~20-40% faster (~70 vs ~140 ms) and in some cases such as EC2 driver even more.

Now majority of the import time is spent in importing requests library. (GITHUB-1519) [Tomaz Muraus]

• libcloud.pricing.get\_size\_price() function has been updated so it only caches pricing data in memory for the requested drivers.

This way we avoid caching data in memory for drivers which may never be used.

If you want to revert to old behavior (cache pricing data for all the drivers in memory), you can do that by passing cache\_all=True argument to that function or set libcloud.pricing.CACHE\_ALL\_PRICING\_DATA module level variable to True.

Passing cache\_all=True might come handy in situations where you know the application will work with a lot of different drivers - this way you can avoid multiple disk reads when requesting pricing data for different drivers. (GITHUB-1519) [Tomaz Muraus]

• Advertise Python 3.9 support in setup.py.

## Compute

- [GCE] Fix ex\_set\_image\_labels method using incorrect API path. (GITHUB-1485) [Poul Petersen @petersen-poul]
- [OpenStack] Fix error setting ex\_force\_XXX\_url without setting ex\_force\_base\_url. (GITHUB-1492) [Miguel Caballer @micafer]
- [EC2] Update supported EC2 regions and instance sizes and add support for eu-north-1 region. (GITHUB-1486) [Arturo Noha @r2ronoha]
- [Ovh] Add support for multiple regions to the driver. User can select a region (location) by passing location argument to the driver constructor (e.g. location=ca). (GITHUB-1494) [Dan Hunsaker @danhunsaker]
- [GCE] Add support for creating nodes without a service account associated with them. Now when an empty list is passed for ex\_service\_accounts argument, VM will be created without service account attached.
  - For backward compatibility reasons, default value of None still means to use a default service account. (GITHUB-1497, GITHUB-1495) [David Tomaschik Matir]
- [VSphere] Add new VMware VSphere driver which utilizes pyvmomi library and works under Python 3.
  - If you want to use this driver, you need to install pyvmomi dependency pip install pyvmomi (GITHUB-1481) [Eis D. Zaster @Eis-D-Z]
- [OpenStack] Enable to get Quota Set detail. (GITHUB-1495) [Miguel Caballer @micafer]
- [OpenStack] Add ex\_get\_size\_extra\_specs function to OpenStack driver. (GITHUB-1517) [Miguel Caballer @micafer]
- [OpenStack] Enable to get Neutron Quota details in OpenStack driver. (GITHUB-1514) [Miguel Caballer @micafer]
- [DigitalOcean] \_node\_node method now ensures image and size attributes are also set correctly and populated on the Node object. (GITHUB-1507, GITHUB-1508) [@sergerdn]
- [Vultr] Make sure private\_ips attribute on the Node object is correctly populated when listing nodes. Also add additional values to the node.extra dictionary. (GITHUB-1506) [@sergerdn]
- [EC2] Optimize EC2 driver imports and move all the large constant files to separate modules in libcloud/compute/constants/ec2\_\*.py files.

Previously all the constants were contained in libcloud/compute/constants.py file. That file was imported when importing EC2 driver which would add unnecessary import time and memory overhead in case this data was not actually used.

Now most of the large imports are lazy and only happen when that data is needed (aka when list\_sizes() method is called).

- libcloud/compute/constants.py file has also been removed. (GITHUB-1519) [Tomaz Muraus @Kami]
- [Packet / Equinix Metal] Packet driver has been renamed to Equinix Metal. If your code uses Packet.net driver, you need to update it as per example in Upgrade Notes documentation section. (GITHUB-1511) [Dimitris Galanis @dimgal1]

- [OutScale] Add various extension methods to the driver. For information on available extenion methods, please refer to the driver documentation. (GITHUB-1499) [@tgn-outscale]
- [Linode] Add support for Linode's API v4. (GITHUB-1504) [Dimitris Galanis @dimgal1]

- Deprecated lockfile library which is used by the Local Storage driver has been replaced with fasteners library. [Tomaz Muraus @Kami]
- [S3] Add support for us-gov-east-1 region. (GITHUB-1509, GITHUB-1510) [Andy Spohn @spohnan]
- [DigitalOcean Spaces] Add support for sfo2 regon. (GITHUB-1525) [Cristian Rasch @cristianrasch]
- [MinIO] Add new driver for MinIO object storage (https://min.io). (GITHUB-1528, GITHUB-1454) [Tomaz Muraus @Kami]
- [S3] Update S3 and other drivers which are based on the S3 one (Google Storage, RGW, MinIO) to correctly throw ContainerAlreadyExistsError if container creation fails because container with this name already exists.

Previously in such scenario, InvalidContainerNameError exception which does not comply with the Libcloud standard API was thrown. (GITHUB-1528) [Tomaz Muraus - @Kami]

• Add new libcloud.common.base.ALLOW\_PATH\_DOUBLE\_SLASHES module level variable.

When this value is set to True (defaults to False for backward compatibility reasons), Libcloud won't try to sanitize the URL path and remove any double slashes.

In most cases, this won't matter and sanitzing double slashes is a safer default, but in some cases such as S3, where double slashes can be a valid path (e.g. /my-bucket//path1/file.txt), this option may come handy.

When this variable is set to True, behavior is also consistent with Libcloud versions prior to v2.0.0.

Reported by Jonathan Hanson - @triplepoint. (GITHUB-1529) [Tomaz Muraus - @Kami]

#### **DNS**

• [Common] Fix a bug with the header value returned by the export\_zone\_to\_bind\_format method containing an invalid timestamp (value for the minute part of the timestamp was wrong and contained month number instead of the minutes value).

Reported by Kurt Schwehr - @schwehr.

(GITHUB-1500) [Tomaz Muraus - @Kami]

- [CloudFlare DNS] Add support for creating SSHFP records. (GITHUB-1512, GITHUB-1513) [Will Hughes @insertjokehere]
- [DigitalOcean] Update driver and make sure request data is sent as part of HTTP request body on POST and PUT operations (previously it was sent as part of query params). (GITHUB-1505) [Andrew Starr-Bochicchio @andrewsomething]
- [AuroraDNS] Throw correct exception on 403 authorization failed API error. (GITHUB-1521, GITHUB-1522) [Freek Dijkstra @macfreek]
- [Linode] Add support for Linode's API v4. (GITHUB-1504) [Dimitris Galanis @dimgal1]
- [CloudFlare] Update driver so it correctly throws RecordAlreadyExists error on various error responses which represent this error. [Tomaz Muraus @Kami]

## Changes in Apache Libcloud 3.2.0

#### Common

• libcloud.pricing.download\_pricing\_file function has been updated so it tries to download latest pricing.json file from our public read-only S3 bucket.

We now run a daily job as part of our CI/CD which scrapes provider prices and publishes the latest version of the pricing. json file to that bucket.

For more information, please see https://libcloud.readthedocs.io/en/latest/compute/pricing.html.

# **Compute**

• [OpenStack] Add *ex\_get\_network()* to the OpenStack driver to make it possible to retrieve a single network by using the ID.

(GITHUB-1474) [Sander Roosingh - @SanderRoosingh]

• [OpenStack] Fix pagination in the list\_images() method and make sure method returns all the images, even if the result is spread across multiple pages.

(GITHUB-1467) [Thomas Bechtold - @toabctl]

- [GCE] Add script for scraping GCE pricing data and improve price addition in \_to\_node\_size method. (GITHUB-1468) [Eis D. Zaster @Eis-D-Z]
- [AWS EC2] Update script for scraping AWS EC2 pricing and update EC2 pricing data. (GITHUB-1469) [Eis D. Zaster @Eis-D-Z]
- [Deployment] Add new wait\_period argument to the deploy\_node method and default it to 5 seconds.

This argument tells Libcloud how long to wait between each poll interval when waiting for a node to come online and have IP address assigned to it.

Previously this argument was not exposed to the end user and defaulted to 3 seconds which means it would be quite easy to reach rate limits with some providers when spinning up many instances concurrently using the same credentials. [Tomaz Muraus - @Kami]

- [Azure ARM] Add script for scraping Azure ARM instance pricing data. (GITHUB-1470) [Eis D. Zaster @Eis-D-Z]
- Update deploy\_node() method to try to re-connect to the server if we receive "SSH connection not active" error when trying to run a deployment step.

In some scenarios, connection may get closed by the server for whatever reason before finishing all the deployment steps and in this case only re-connecting would help and result in a successful outcome. [Tomaz Muraus - @Kami]

• [Deployment] Make FileDeployment class much faster and more efficient when working with large files or when running multiple FileDeployment steps on a single node.

This was achieved by implementing two changes on the ParamikoSSHClient class:

- 1. put () method now tries to re-use the existing open SFTP connection if one already exists instead of re-creating a new one for each put () call.
- 2. New putfo() method has been added to the ParamikoSSHClient class which utilizes the underlying sftp.putfo() method.

This method doesn't need to buffer the whole file content in memory and also supports pipelining which makes uploads much faster and more efficient for larger files.

[Tomaz Muraus - @Kami]

- [Deployment] Add \_\_repr\_\_() and \_\_str\_\_() methods to all the Deployment classes. [Tomaz Muraus @Kami]
- [Deployment] New keep\_alive and use\_compression arguments have been added to the ParamikoSSHClient class constructor.

Right now those are not exposed yet to the deploy\_node() method. [Tomaz Muraus - @Kami]

• [Deployment] Update ParamikoSSHClient.put() method so it returns a correct path when commands are being executed on a Windows machine.

Also update related deployment classes so they correctly handle situation when we are executing commands on a Windows server. [Arthur Kamalov, Tomaz Muraus]

- [Outscale] Add a new driver for the Outscale provider. Existing Outscale driver utilizes the EC2 compatible API and this one utilizes native Outscale API. (GITHUB-1476) [Tio Gobin @tgn-outscale]
- [KubeVirt] Add new methods for managing services which allows users to expose ports for the VMs (ex\_list\_services, ex\_create\_service, ex\_delete\_service). (GITHUB-1478) [Eis D. Zaster @Eis-D-Z]

#### Container

• [LXD] Add new methods for managing network and storage pool capabilities and include other improvements in some of the existing methods. (GITHUB-1477) [Eis D. Zaster - @Eis-D-Z]

#### Changes in Apache Libcloud 3.1.0

#### Compute

• [GCE] Add latest Ubuntu image families (Ubuntu 20.04) to the driver.

(GITHUB-1449) [Christopher Lambert - @XN137]

• [DigitalOcean] Add location argument to the list sizes() method.

NOTE: Location filtering is performed on the client. (GITHUB-1455, GITHUB-1456) [RobertH1993]

• Fix deploy\_node() so an exception is not thrown if any of the output (stdout / stderr) produced by the deployment script contains a non-valid utf-8 character.

Previously, user would see an error similar to "Failed after 3 tries: 'utf-8' codec can't decode byte 0xc0 in position 37: invalid start byte".

And now we simply ignore byte sequences which we can't decode and include rest of the output which can be decoded.

(GITHUB-1459) [Tomaz Muraus - @Kami]

 $\bullet \ \ Add \ new \ \texttt{timeout} \ argument \ to \ \texttt{ScriptDeployment} \ and \ \texttt{ScriptFileDeployment} \ class \ constructor.$ 

With this argument, user can specify an optional run timeout for that deployment step run. (GITHUB-1445) [Tomaz Muraus - @Kami]

• [GiG G8] Fix retry functionality when creating port forwards and add support for automatically refresing the JWT auth token inside the connection class if it's about to expire in 60 seconds or less. (GITHUB-1465) [Jo De Boeck - @grimpy]

• [Azure ARM] Update create\_node so an exception is thrown if user passes ex\_use\_managed\_disks=False, but doesn't provide a value for the ex\_storage\_account argument. (GITHUB-1448) [@antoinebourayne]

## **Storage**

• [AWS S3] Make sure driver works correctly for objects with ~ in the name.

Now when sanitizing the object name, we don't url encode ~ character.

Reported by Michael Militzer - @mmilitzer. (GITHUB-1452, GITHUB-1457) [Tomaz Muraus]

#### **DNS**

• [CloudFlare] Update driver to include the whole error chain the thrown exception message field.

This makes various issues easier to debug since the whole error context is included. [Tomaz Muraus]

• [Gandi Live, CloudFlare, GCE] Add support for managing CAA record types.

When creating a CAA record, data field needs to be in the following format:

```
<flags> <tag> <domain name>
```

#### For example:

- 0 issue caa.example.com
- 0 issuewild caa.example.com
- 0 iodef https://example.com/reports

(GITHUB-1463, GITHUB-1464) [Tomaz Muraus]

• [Gandi Live] Don't throw if extra['rrset\_ttl'] argument is not passed to the create\_record method. (GITHUB-1463) [Tomaz Muraus]

#### Other

• Update contrib/Dockerfile which can be used for running tests so it only run tests with Python versions we support. This means dropping support for Python < 3.5 and adding support for Python 3.7 and 3.8.

Also update it to use a more recent Ubuntu version (18.04) and Python 3 for running tox target. (GITHUB-1451) [Tomaz Muraus - @Kami, HuiFeng Tang - @99Kies]

### Changes in Apache Libcloud 3.0.0

#### Common

• Make sure auth\_user\_info variable on the OpenStack identify connection class is populated when using auth version 3.x\_password and 3.x\_oidc\_access\_token.

(GITHUB-1436) [@lln-ijinus, Tomaz Muraus)

• [OpenStack] Update OpenStack identity driver so a custom project can be selected using domain\_name keyword argument containing a project id.

Previously this argument value could only contain a project name, now the value will be checked against project name and id.

(GITHUB-1439) [Miguel Caballer - @micafer]

### Compute

• [GCE] Update <code>create\_node()</code> method so it throws an exception if node location can't be inferred and location is not specified by the user (either by passing datacenter constructor argument or by passing location argument to the method).

Reported by Kevin K. - @kbknapp. (GITHUB-1443) [Tomaz Muraus]

- [GCE] Update ex\_get\_disktype method so it works if zone argument is not set. (GITHUB-1443) [Tomaz Muraus]
- [GiG G8] Add new driver for GiG G8 provider (https://gig.tech/). (GITHUB-1437) [Jo De Boeck @grimpy]
- Add new at\_exit\_func argument to deploy\_node() method. With this argument user can specify which function will be called before exiting with the created node in question if the deploy process has been canceled after the node has been created, but before the method has fully finished.

This comes handy since it simplifies various cleanup scenarios. (GITHUB-1445) [Tomaz Muraus - @Kami]

- [OpenStack] Fix auto assignment of volume device when using device name auto in the attach\_volume method. (GITHUB-1444) [Joshua Hesketh @jhesketh]
- [Kamatera] Add new driver for Kamatera provider (https://www.kamatera.com). (GITHUB-1442) [Ori Hoch @OriHoch]

### **Storage**

• Add new download\_object\_range and download\_object\_range\_as\_stream methods for downloading part of the object content (aka range downloads) to the base storage API.

Currently those methods are implemented for the local storage Azure Blobs, CloudFiles, S3 and any other provider driver which is based on the S3 one (such as Google Storage and DigitalOcean Spaces). (GITHUB-1431) [Tomaz Muraus]

- Add type annotations for the base storage API. (GITHUB-1410) [Clemens Wolff @c-w]
- [Google Storage] Update the driver so it supports service account HMAC credentials.

There was a bug in the code where we used the user id length check to determine the account type and that code check didn't take service account HMAC credentials (which contain a longer string) into account.

Reported by Patrick Mézard - pmezard. (GITHUB-1437, GITHUB-1440) [Yoan Tournade - @MonsieurV]

#### **DNS**

• Add type annotations for the base DNS API. (GITHUB-1434) [Tomaz Muraus]

## Container

- [Kubernetes] Add support for the client certificate and static token based authentication to the driver. (GITHUB-1421) [Tomaz Muraus]
- Add type annotations for the base container API. (GITHUB-1435) [Tomaz Muraus]

## Changes in Apache Libcloud v2.8.3

### Compute

• Fix deploy\_node() so an exception is not thrown if any of the output (stdout / stderr) produced by the deployment script contains a non-valid utf-8 character.

Previously, user would see an error similar to "Failed after 3 tries: 'utf-8' codec can't decode byte 0xc0 in position 37: invalid start byte".

And now we simply ignore byte sequences which we can't decode and include rest of the output which can be decoded.

(GITHUB-1459) [Tomaz Muraus - @Kami]

### **Storage**

• [AWS S3] Make sure driver works correctly for objects with ~ in the name.

Now when sanitizing the object name, we don't url encode ~ character.

Reported by Michael Militzer - @mmilitzer. (GITHUB-1452, GITHUB-1457) [Tomaz Muraus]

#### Changes in Apache Libcloud v2.8.2

#### Compute

- Add support for Ed25519 private keys for deploy\_node() functionality when using paramiko >= 2.2.0. (GITHUB-1445) [Tomaz Muraus @Kami]
- Fix deploy\_node() so it correctly propagates an exception is a private key which is used is password protected, but no password is specified.
  - Previously it incorrectly tried to retry on such exception. This means the exception would only bubble up after all the retry attempts have been exhausted. (GITHUB-1445) [Tomaz Muraus @Kami]
- Allow user to specify password for encrypted keys by passing ssh\_key\_password argument to the deploy\_node() method.

Previously they (GITHUB-1445) [Tomaz Muraus - @Kami]

- Fix deploy\_node () so it correctly propagates an exception if invalid or unsupported private key is used.
  - Previously it incorrectly tried to retry on such exception. This means the exception would only bubble up after all the retry attempts have been exhausted. (GITHUB-1445) [Tomaz Muraus @Kami]
- Fix deploy\_node() method so we don't retry on fatal SSHCommandTimeoutError exception (exception which is thrown when a command which is running on remote host times out). (GITHUB-1445) [Tomaz Muraus @Kami]

- Add new timeout argument to ScriptDeployment and ScriptFileDeployment class constructor.

  With this argument, user can specify an optional run timeout for that deployment step run. (GITHUB-1445)

  [Tomaz Muraus @Kami]
- Add new stdout and stderr attribute to SSHCommandTimeoutError class.
  - Those attributes contain value of stdout and stderr produced so far. (GITHUB-1445) [Tomaz Muraus @Kami]
- [OpenStack] Fix auto assignment of volume device when using device name auto in the attach\_volume method. (GITHUB-1444) [Joshua Hesketh @jhesketh]

### Changes in Apache Libcloud v2.8.1

#### Common

• Fix LIBCLOUD\_DEBUG\_PRETTY\_PRINT\_RESPONSE functionality and make sure it works correctly under Python 3 when response.read() function returns unicode and not bytes.

(GITHUB-1430) [Tomaz Muraus]

### Compute

• [GCE] Fix list\_nodes() method so it correctly handles pagination and returns all the nodes if there are more than 500 nodes available in total.

Previously, only first 500 nodes were returned.

Reported by @TheSushiChef. (GITHUB-1409, GITHUB-1360) [Tomaz Muraus]

• Fix some incorrect type annotations in the base compute API.

Reported by @dpeschman. (GITHUB-1413) [Tomaz Muraus]

- [OpenStack] Fix error with getting node id in \_to\_floating\_ip method when region is not called nova. (GITHUB-1411, GITHUB-1412) [Miguel Caballer @micafer]
- [EC2] Fix ex\_userdata keyword argument in the create\_node() method being ignored / not working correctly.

NOTE: This regression has been inadvertently introduced in v2.8.0. (GITHUB-1426) [Dan Chaffelson - @Chaffelson]

• [EC2] Update create\_volume method to automatically select first available availability zone if one is not explicitly provided via location argument. [Tomaz Muraus]

#### Storage

- [AWS S3] Fix upload object code so uploaded data MD5 checksum check is not performed at the end of the upload when AWS KMS server side encryption is used.
  - If AWS KMS server side object encryption is used, ETag header value in the response doesn't contain data MD5 digest so we can't perform a checksum check.
  - Reported by Jonathan Harden @jfharden. (GITHUB-1401, GITHUB-1406) [Tomaz Muraus @Kami]
- [Google Storage] Fix a bug when uploading an object would fail and result in 401 "invalid signature" error when object mime type contained mixed casing and when S3 Interoperability authentication method was used.
  - Reported by Will Abson wabson. (GITHUB-1417, GITHUB-1418) [Tomaz Muraus]

• Fix upload\_object\_via\_stream method so "Illegal seek" errors which can arise when calculating iterator content hash are ignored. Those errors likely indicate that the underlying file handle / iterator is a pipe which doesn't support seek and that the error is not fatal and we should still proceed.

```
Reported by Per Buer - @perbu.
(GITHUB-1424, GITHUB-1427) [Tomaz Muraus]
```

#### **DNS**

- [Gandi Live] Update the driver and make sure it matches the latest service / API updates. (GITHUB-1416) [Ryan Lee @zepheiryan]
- [CloudFlare] Fix export\_zone\_to\_bind\_format method.

Previously it threw an exception, because record.extra dictionary didn't contain priority key.

Reported by James Montgomery - @gh-jamesmontgomery. (GITHUB-1428, GITHUB-1429) [Tomaz Muraus]

### Changes in Apache Libcloud v2.8.0

#### Common

- Fix a regression with get\_driver() method not working if provider argument value was a string (e.g. using get\_driver('openstack') instead of get\_driver(Provider.OPENSTACK)).
  - Only officially supported and recommended approach still is to use Provider. FOO enum type constant, but since the string notation was unofficially supported in the past, we will still support it until the next major release.
  - Reported by @dpeschman. (GITHUB-1391, GITHUB-1390) [Tomaz Muraus]
- Include py.typed data file to signal that this package contains type annotations / hints.
  - NOTE: At the moment, type annotations are only available for the base compute API. [Tomaz Muraus]
- Fix universal wheel METADATA and ensure conditional dependencies (backports.ssl\_match\_hostname, typing, enum34) are handled correctly.
  - Reported by Adam Terrey (@arterrey). (GITHUB-1392, GITHUB-1393) [Tomaz Muraus]

## Compute

- [DigitalOcean] Fix attach\_volume and detach\_volume methods. Previously those two methods incorrectly passed volume id instead of volume name to the API. (GITHUB-1380) [@mpempekos]
- [GCE] Add ex\_disk\_size argument to the create\_node method. (GITHUB-1386, GITHUB-1388) [Peter Yu @yukw777]
- [VMware vCloud] Various improvements, fixes and additions to the driver. (GITHUB-1373) [OpenText Corporation]
- Update deploy\_node() method so it now only passes non-deploy node keyword arguments + auth argument to the underlying create\_node() method. Previously it also passed deploy\_node() specific arguments such as deploy, ssh\_username, max\_tries, etc. to it.

Because of that, a lot of the compute drivers which support deploy functionality needed to use \*\*kwargs in create\_node() method signature which made code hard to read and error prone.

Also update various affected drivers to explicitly declare supported arguments in the <code>create\_node()</code> method signature (Dummy, Abiquo, Joyent, Bluebox, OpenStack, Gandy, VCL, vCloud, CloudStack, GoGrid HostVirtual, CloudSigma, ElasticStack, RimuHosting, SoftLayer, Voxel, Vpsnet, KTUcloud, BrightBox, ECP, OpenNebula, UPcloud).

As part of this change, also various issues with invalid argument names were identified and fixed. (GITHUB-1389) [Tomaz Muraus]

- Add MyPy type annotations for create\_node() and deploy\_node() method. (GITHUB-1389) [Tomaz Muraus]
- [GCE] Update deploy\_node() method so it complies with the base compute API and accepts deploy argument.

This method now also takes all the same keyword arguments which original create\_node() takes. (GITHUB-1387) [Peter Yu - @yukw777, Tomaz Muraus]

- [Common] To make debugging and troubleshooting easier, add \_\_repr\_\_ and \_\_str\_\_ method to the ScriptDeployment class. [Tomaz Muraus]
- [Common] Add type annotations / hints for rest of the base compute API classes and methods. [Tomaz Muraus]

### **Storage**

• [AWS S3] Make sure host driver constructor argument has priority over region argument.

This means if you specify host and region argument, host won't be inferred from the region, but host argument will be used for the actual connection host value. (GITHUB-1384, GITHUB-1383) [@gluap]

#### Changes in Apache Libcloud v2.7.0

#### General

• Test code with Python 3.8 and advertise that we also support Python 3.8. (GITHUB-1371, GITHUB-1374) [Tomaz Muraus]

#### Common

• [OpenStack] Fix OpenStack project scoped token authentication. The driver constructors now accept ex\_tenant\_domain\_id argument which tells authentication service which domain id to use for the scoped authentication token. (GITHUB-1367) [kshtsk]

### Compute

- Introduce type annotations for the base compute API methods. This means you can now leverage mypy to type check (with some limitations) your code which utilizes Libcloud compute API standard API methods.
  - Keep in mind that at this point, type annotations are only available for standard compute API methods. (GITHUB-1306) [Tomaz Muraus]
- [Azure ARM] Fix attach\_volume method and allow maximum of 64 disks to be added when LUN is not specified. Previously there was a bug and only a maximum of 63 disks could be added. (GITHUB-1372) [Palash Gandhi @palashgandhi]

 New start\_node and stop\_node methods have been added to the base Libcloud compute API NodeDriver class.

A lot of the existing compute drivers already implemented that functionality via extension methods (ex\_start\_node, ex\_stop\_node) so it was decided to promote those methods to be part of the standard Libcloud compute API and update all the affected drivers.

For backward compatibility reasons, existing ex\_start and ex\_stop\_node methods will still work until a next major release.

(GITHUB-1375, GITHUB-1364) [Tomaz Muraus, @emakarov]

- [GCE] Add new ex\_set\_volume\_labels method for managing volume labels to the driver. (GITHUB-1376) [Rob Zimmerman @zimventures]
- [EC2] Add support for new inf1.\* instance types. [Tomaz Muraus]

# **Storage**

• [S3] Update S3 driver so a single driver class can be used for different regions.

Region which is used is controlled by the region driver constructor argument.

Previously, that driver followed "driver class per region" approach. That approach will be deprecated and removed in a future release.

For more information, please refer to the Upgrade Notes documentation section. (GITHUB-1371) [Tomaz Muras]

- [S3] Add missing eu-north-1 region to the S3 driver. (GITHUB-1370) [michaelsembwever]
- [S3] Add missing regions (eu-west-3, ap-northeast-3, me-south-1) to the driver. (GITHUB-1371) [Tomaz Muras]
- [S3] Update the driver to throw more user-friendly error message if user is using driver for a region X, but trying to upload / download object to / from a region Y. (GITHUB-1371) [Tomaz Muras]

### Changes in Apache Libcloud 2.6.1

### Compute

- [Packet] Update list\_sizes method so it accepts ex\_project\_id argument and works with project API tokens. (GITHUB-1351) [Dimitris Moraitis @d-mo]
- [GCE] Fix GCEProject.set\_common\_instance\_metadata and GCEproject.set\_usage\_export\_bucket method. (GITHUB-1354) [Aitor Zabala @aitorzabala, Tomaz Muraus @Kami]
- [GCE] Add sync / ex\_sync argument to the ex\_stop\_node, ex\_start\_node and destroy\_node method. When this argument is set to False, method will return immediately without waiting polling and waiting for a long running API operation to finish before returning. For backward compatibility reasons, it defaults to True. (GITHUB-1357) [Rob Zimmerman zimventures]
- [GCE] Update list of image projects and add new centos-8 and debian-10 based images. (GITHUB-1358) [Christopher Lambert XN137]
- [OpenStack v2] Add new ex\_image\_ref argument to the create\_volume method. This way bootable volumes can be created from specific images. (GITHUB-1363) [Rick van de Loo]

- [OpenStack v2] Update create\_node\_method and allow users to create nodes from bootable volumes without specifying image argument. (GITHUB-1362) [Rick van de Loo]
- [AWS] Re-generate and update available EC2 instance sizes and pricing data. [Tomaz Muraus]

• [Common, S3, GCS] Reuse TCP connections when uploading files (GITHUB-1353) [Quentin Pradet]

#### **Load Balancer**

• [AWS] Implement various create methods in the driver. (GITHUB-1349) [Anton Kozyrev - @Irvan]

# **Changes in Apache Libcloud 2.6.0**

#### General

- [OpenStack] Update OpenStack identity driver so a custom project can be selected using domain\_name keyword argument. Previously, that wasn't possible and the first project which was returned by the API was always selected. (GITHUB-1293) [Miguel Caballer @micafer]
- Add new extra attribute to the base NodeLocation class. (GITHUB-1282) [Dimitris Moraitis @d-mo]
- Remove various code patterns which were in place for supporting multiple Python versions, including 2.5 and 2.6. Libcloud hasn't supported Python < 2.7 for a while now, so we can remove that code. (GITHUB-1307) [Tomaz Muraus]
- Also run pylint on libcloud/compute/ directory and fix various pylint violations. (GITHUB-1308) [Tomaz Muraus]
- [OpenStack] Remove unused variable in parse\_error (GITHUB-1260) [Rick van de Loo]
- Add support for HTTPS proxies and fix driver.set\_http\_proxy() method.

HTTPS proxy can be set up by either setting https\_proxy / http\_proxy environment variable or by using driver.connection.set\_http\_proxy method.

For more information, please refer to the documentation - https://libcloud.readthedocs.io/en/latest/other/using-http-proxy.html (GITHUB-1314, GITHUB-1324) [Jim Liu - @hldh214, Tomaz Muraus]

- Fix paramiko debug logging which didn't work when using LIBCLOUD\_DEBUG environment variable. (GITHUB-1315) [Tomaz Muraaus]
- Update paramiko SSH deployment client so it automatically tries to convert private keys in PEM format with a header which paramiko doesn't recognize into a format which paramiko recognizes.

NOTE: Paramiko only supports keys in PEM format. This means keys which start with "—-BEGIN <TYPE> PRIVATE KEY——". Keys in PKCS#8 and newer OpenSSH format are not supported.

For more information, see https://libcloud.readthedocs.io/en/latest/compute/deployment.html#supported-private-ssh-key-types (GITHUB-1314)

- Update Paramiko SSH client to throw a more user-friendly error if a private key file in an unsupported format is used. (GITHUB-1314) [Tomaz Muraus]
- Fix HTTP(s) proxy support in the OpenStack drivers. (GITHUB-1324) [Gabe Van Engel @gvengel]

• Fix logging connection class so it also works when data type is bytearray or bytes. (GITHUB-1339) [Tomaz Muraus]

### Compute

• [Google Compute Engine] Fix the driver so list\_nodes() method doesn't throw if there is a node in a SUSPENDED state.

Also update the code so it doesn't crash if an unknown node state which is not defined locally is returned by the API when listing nodes. Such states are now mapped to UNKNOWN. (GITHUB-1296, LIBCLOUD-1045)

Reported by rafa alistair. [Tomaz Muraus]

- [OpenStack] Fix a bug with retrieving floating IP address when a device\_owner of a port is compute: None. (GITHUB-1295) [Miguel Caballer @micafer]
- [Packet] Add various new extension methods to Packet.net driver (ex\_reinstall\_node, ex\_list\_projects, ex\_get\_bgp\_config\_for\_project, ex\_get\_bgp\_config, ex\_list\_nodes\_for\_project, etc.). (GITHUB-1282) [Dimitris Moraitis @d-mo]
- [Maxihost] Add new compute driver for Maxihost provider (https://www.maxihost.com/). (GITHUB-1298) [Spyros Tzavaras @mpempekos]
- [Azure ARM] Add various improvements to the Azure ARM driver: Add functionality to resize a volume in Azure Add functionality to update the network profile of a node Add functionality to update a network interface's properties Add functionality to check IP address availability (GITHUB-1244) [Palash Gandhi @palashgandhi]
- [EC2] Allow user to pass arbitrary filters to list\_volumes method by passing a dictionary with filters as ex\_filters method argument value. (GITHUB-1300) [Palash Gandhi @palashgandhi]
- [GCE] Add new ex\_instancegroupmanager\_set\_autohealingpolicies method to the GCE driver.

This method allows user to set the auto healing policies (health check to use and initial delay) on GCE instance group. (GITHUB-1286) [Kenta Morris - @kentamorris]

- [GCE] Update GCE driver to include new operating system images such as Ubuntu 18.04, RHEL 8, etc. (GITHUB-1304) [Christopher Lambert @XN137]
- [GCE] Add new ex\_resize\_volume method to the driver. (GITHUB-1301) [Palash Gandhi @palash-gandhi]
- [OpenStack] Add various router management methods to the OpenStack driver. (GITHUB-1281) [Miguel Caballer @micafer]
- [OpenStack] Fix ex resize method. (GITHUB-1311) [Miguel Caballer @micafer]
- [OpenStack] For consistency, rename ex\_resize method to ex\_resize\_node. For backward compatibility reasons, leave ex\_resize alias in place. [Tomaz Muraus]
- [Gridscale] Add new driver for Gridscale provider (https://gridscale.io). (GITHUB-1305, GITHUB-1315) [Sydney Weber @PrinceSydney]
- [Oneandone] Update Oneandone driver to accommodate latest changes to the API. This means removing deprecated ex\_remove\_server\_firewall\_policy method and replacing port\_from and port\_to argument on the firewall policy with a single port attribute. (GITHUB-1230) [Amel Ajdinovic @aajdinov]
- [DigitalOcean] Update list\_locations method in the DigitalOcean driver to only returns regions which are available by default. If you want to list all the regions, you need to pass ex\_available=False argument to the method. (GITHUB-1001) [Markos Gogoulos]

- [EC2] Add new ex\_modify\_subnet\_attribute method to the EC2 driver. (GITHUB-1205) [Dan Hunsaker @danhunsaker]
- [Azure ARM] Add ex\_delete\_public\_ip method to the Azure ARM driver. (GITHUB-1318) [Reza Shahriari redha1419]
- [EC2] Update EC2 driver to throw a more user-friendly exception if a user / developer tries to provide an invalid value type for an item value in the request params dictionary.

Request parameters are sent via query parameters and not via request body, as such, only string values are supported. (GITHUB-1329, GITHUB-1321)

Reported by James Bednell. [Tomaz Muraus]

- [OpenStack] Add new ex\_remove\_security\_group\_from\_node method. (GITHUB-1331) [Miguel Caballer @micafer]
- [OpenStack] Fix broken ex\_update\_port method. (GITHUB-1320) [Miguel Caballer @micafer]
- [Softlayer] Fix a bug with driver incorrectly handling the value of ex\_hourly argument in the create\_node() method which caused nodes to always be created with hourly billing, even if this argument was set to False. (GITHUB-1334, GITHUB-1335) [@r2ronoha]
- [GCE] Add optional cpuPlatform and minCpuPlatform attributes to the node.extra dictionary. (GITHUB-1342, GITHUB-1343) [@yairshemla]

### **Storage**

- [Azure Blobs] Enable the Azure storage driver to be used with the Azurite Storage Emulator and Azure Blob Storage on IoT Edge. (LIBCLOUD-1037, GITHUB-1278) [Clemens Wolff @c-w]
- [Azure Blobs] Fix a bug with Azure storage driver works when used against a storage account that was created using kind=BlobStrage. This includes updating the minimum API version used / supported by the storage driver from 2012-02-12 to 2014-02-14. (LIBCLOUD-851, GITHUB-1202, GITHUB-1294) [Clemens Wolff @c-w, Davis Kirkendall @daviskirk]
- [Azure Blobs] Increase the maximum size of block blobs that can be created to 100 MB. This includes updating the minimum API version used / supported by the storage driver from 2014-02-14 to 2016-05-31. (GITHUB-1340) [Clemens Wolff @c-w]
- [Azure Blobs] Set the minimum required version of requests to 2.5.0 since requests 2.4.0 and earlier exhibit XML parsing errors of Azure Storage responses. (GITHUB-1325, GITHUB-1322) [Clemens Wolff @c-w]
- [Azure Blobs] Detect bad version of requests that leads to errors in parsing Azure Storage responses. This scenario is known to happen on RHEL 7.6 when requests was installed via yum. (GITHUB-1332, GITHUB-1322) [Clemens Wolff @c-w]
- [Common, CloudFiles] Fix upload\_object\_via\_stream and ensure we start from the beginning when calculating hash for the provided iterator. This way we avoid hash mismatch errors in scenario where provided iterator is already iterated / seeked upon before calculating the hash. (GITHUB-1326) [Gabe Van Engel @gvengel, Tomaz Muraus]
- [Backblaze B2] Fix a bug with driver not working correctly due to a regression which was inadvertently introduced in one of the previous releases. (GITHUB-1338, GITHUB-1339)

Reported by Shawn Nock - @nocko. [Tomaz Muraus]

• [Backblaze B2] Fix upload\_object\_via\_stream method. (GITHUB-1339) [Tomaz Muraus]

#### **DNS**

- [Cloudflare] Re-write the Cloudflare DNS driver to use Cloudflare API v4. (LIBCLOUD-1001, LIBCLOUD-994, GITHUB-1292) [Clemens Wolff @c-w]
- [Gandi LiveDNS] Add new driver for Gandi LiveDNS service. (GITHUB-1323) [Ryan Lee @zepheiryan]
- [PowerDNS] Update driver so it works with API v3 and v4. #1328 [@biggosh]

# Changes in Apache Libcloud 2.5.0

#### General

- [NTT CIS] Add loadbalancer and compute drivers for NTT-CIS, rename dimensiondata modules to NTT-CIS. (GITHUB-1250) [Mitch Raful]
- [NTT CIS] Fix loadbalancer docs. (GITHUB-1270) [Mitch Raful]
- Use assertIsNone instead of assertEqual with None in tests (GITHUB-1264) [Ken Dreyer]
- Updating command line arguments to current version in Azure examples. (GITHUB-1273) [mitar]
- [GCE, SoftLayer] Update GCE and Softlayer drivers to utilize crypto primitives from the cryptography library instead of deprecated and unmaintained PyCrypto library.
  - (GITHUB-1280) [Ryan Petrello]
- Fix libcloud.enable\_debug function so it doesn't leak open file handle and closes the open file when the program exits when a debug mode is used. [Tomaz Muraus]
- Update various drivers (CloudFiles, NTT CIS etc.) so they don't leak open file handles in some situations. [Tomaz Muraus]

#### Common

- [OpenStack] Handle missing user enabled attribute (GITHUB-1261) [Ken Dreyer]
- [Google Cloud Storage] Handle Interoperability access keys of more than 20 characters. (GITHUB-1272) [Yoan Tournade]

## Compute

- [OpenStack] Implement OpenStack\_1\_1\_NodeDriver ex\_get\_snapshot (GITHUB-1257) [Rick van de Loo]
- [OpenStack] Pagination in various OpenStack\_2\_NodeDriver methods (GITHUB-1263) [Rick van de Loo]
- [OpenStack] Implement OpenStack\_2\_NodeDriver ex\_create\_subnet (LIBCLOUD-874, GITHUB-1242) [Miguel Caballer]
- [OpenStack] Implement OpenStack\_2\_NodeDriver ex\_delete\_subnet (LIBCLOUD-874, GITHUB-1242) [Miguel Caballer]
- [OpenStack] Implement OpenStack\_2\_NodeDriver list\_volumes (LIBCLOUD-874, GITHUB-1242) [Miguel Caballer]
- [OpenStack] Implement OpenStack\_2\_NodeDriver ex\_get\_volume (LIBCLOUD-874, GITHUB-1242) [Miguel Caballer]

- [OpenStack] Implement OpenStack\_2\_NodeDriver create\_volume (LIBCLOUD-874, GITHUB-1242) [Miguel Caballer]
- [OpenStack] Implement OpenStack\_2\_NodeDriver destroy\_volume (LIBCLOUD-874, GITHUB-1242) [Miguel Caballer]
- [OpenStack] Implement OpenStack\_2\_NodeDriver ex\_list\_snapshots (LIBCLOUD-874, GITHUB-1242) [Miguel Caballer]
- [OpenStack] Implement OpenStack\_2\_NodeDriver create\_volume\_snapshot (LIBCLOUD-874, GITHUB-1242) [Miguel Caballer]
- [OpenStack] Implement OpenStack\_2\_NodeDriver destroy\_volume\_snapshot (LIBCLOUD-874, GITHUB-1242) [Miguel Caballer]
- [OpenStack] Implement OpenStack\_2\_NodeDriver ex\_list\_security\_groups (LIBCLOUD-874, GITHUB-1242) [Miguel Caballer]
- [OpenStack] Implement OpenStack\_2\_NodeDriver ex\_create\_security\_group (LIBCLOUD-874, GITHUB-1242) [Miguel Caballer]
- [OpenStack] Implement OpenStack\_2\_NodeDriver ex\_delete\_security\_group (LIBCLOUD-874, GITHUB-1242) [Miguel Caballer]
- [OpenStack] Implement OpenStack\_2\_NodeDriver ex\_create\_security\_group\_rule (LIBCLOUD-874, GITHUB-1242) [Miguel Caballer]
- [OpenStack] Implement OpenStack\_2\_NodeDriver ex\_delete\_security\_group\_rule (LIBCLOUD-874, GITHUB-1242) [Miguel Caballer]
- [OpenStack] Implement OpenStack\_2\_NodeDriver ex\_list\_floating\_ip\_pools (LIBCLOUD-874, GITHUB-1242) [Miguel Caballer]
- [OpenStack] Fix parse\_error if 'code' not in API response message (GITHUB-1242) [Miguel Caballer]
- [OpenStack] Adapt \_to\_port function to work with old OpenStack versions (GITHUB-1242) [Miguel Caballer]
- [OpenStack] Use SUSPENDED NodeState in OpenStack driver (GITHUB-1269) [Miguel Caballer]
- [UpCloud] Update documentation for UpCloud driver (LIBCLOUD-1026, GITHUB-1259) [Ilari Mäkelä]
- [NTT CIS] Fix indenting in ex\_initiate\_drs\_failover docstring (GITHUB-1271) [Rick van de Loo]
- [NTT CIS] Change endpoint 'canada' to 'ca' in libcloud/common/nttcis.py (GITHUB-1270) [Mitch Raful]
- [OpenStack] Fix detach\_volume method so it works with v2 volumes. (GITHUB-1267) [Rick van de Loo]
- [CloudSigma] Fix CloudSigma driver so it correctly handles subscription objects without the start\_time and / or end\_time attribute. (GITHUB-1284, LIBCLOUD-1040) [aki-k, Tomaz Muraus]

- [Azure] Fix upload\_object\_via\_stream method so it also works with iterators which don't implement seek() method. If the iterator doesn't support seek, entire iterator content will be buffered in memory. (LIBCLOUD-1043, GITHUB-1287) [Clemens Wolff]
- [CloudFiles] Fix download\_object\_as\_stream method in the CloudFiles driver. This regression / bug was inadvertently introduced when migrating code to requests. (LIBCLOUD-1039, GITHUB-1283) [Matt Seymour]
- [CloudFiles] Fix a bug with ChunkStreamReader class and make sure file descriptor is also closed if the iterator isn't fully exhausted or if the iterator is never read from.

NOTE: This potential open file descriptor leakage only affected code which utilized ex\_multipart\_upload\_object method. [Tomaz Muraus]

#### Container

• [Docker] Improve docstring for RegistryClient (GITHUB-1254) [Ken Dreyer]

#### **DNS**

- Add new driver for RcodeZero DNS (GITHUB-1256, LIBCLOUD-1025) [MikeAT]
- [DigitalOcean] Update DigitalOcean driver so it supports ttl attribute for Record objects. This includes support for specifying a record ttl via extra['ttl'] attribute when creating and updating a record. (GITHUB-1252 LIBCLOUD-1022) [Kevin Roy]

# **Storage**

• Adds missing docs for param ex\_prefix & adds to DummyStore. Add ex\_prefix kwarg to the *list\_container\_objects* methods in the base and dummy classes. (GITHUB-1275) [RichardARPANET]

### Changes in Apache Libcloud 2.4.0

- Refuse installation with Python 2.6 and Python 3.3 (support was already dropped in Libcloud 2.3.0)
- Support Python 3.7 (GITHUB-1227, GITHUB-1236) [Andreas Hasenack, Andrew Starr-Bochicchio, Quentin Pradet]
- Cleanup various Python files (GITHUB-1182, GITHUB-1183, GITHUB-1185, GITHUB-1186, GITHUB-1187, GITHUB-1188) [Rémy Léone]
- Allow running tests with http\_proxy set (GITHUB-1236) [Andreas Hasenack]

### Common

- [OpenStack] Document openstack\_connection\_kwargs method (GITHUB-1219) [Ken Dreyer]
- [OpenStack] Handle missing user email in OpenStackIdentityUser (GITHUB-1249) [Ken Dreyer]

#### Compute

- [ARM] Support OS disk size definition on node creation (GITHUB-1196) [Vojta Bartos]
- [Digital Ocean] Support floating IPs (GITHUB-1177) [Rick van de Loo]
- [Digital Ocean] Support attach/detach for floating IPs (GITHUB-1191) [Rick van de Loo]
- [Digital Ocean] Add ex\_get\_node\_details (GITHUB-1221) [Rick van de Loo]
- [Digital Ocean] Add tags extra attribute to create\_node (GITHUB-1212) [Nikita Chebykin]
- [Dimension Data] Fix IndexError in list\_images (GITHUB-1171) [Adam Friedman]
- [EC2] Add AWS eu-west-3 (Paris) region (GITHUB-1175) [Anthony Monthe]

- [EC2] Add description to ex\_authorize\_security\_group\_ingress (GITHUB-1122) [Arturo Noha]
- [EC2] Added script to automatically get EC2 instance sizes (GITHUB-1211) [Anthony Monthe, Quentin Pradet]
- [EC2] Update instance sizes (GITHUB-1238) [Ward Vandewege]
- [EC2] Accept tags when create a snapshot (LIBCLOUD-1014, GITHUB-1240) [Rafael Gonçalves]
- [GCE] Expand Firewall options coverage (LIBCLOUD-960, GITHUB-1144) [maxlip]
- [GCE] Expand network and subnetwork options coverage (LIBCLOUD-985, GITHUB-1181) [maxlip]
- [GCE] Extend ex\_create\_address to allow internal ip creation (GITHUB-1174) [Jeremy Solarz]
- [GCE] Allow shared VPC in managed instance group creation (GITHUB-1179) [Boris Chazalet]
- [GCE] Support disk\_size parameter for boot disk when creating instance (LIBCLOUD-973, GITHUB-1162) [Rahul Paigavan]
- [GCE] Update public image projects list (LIBCLOUD-961, GITHUB-1143) [Sean Marlow]
- [GCE] Fix \_find\_zone\_or\_region for >500 instances (GITHUB-1203) [Léo Ferlin-Sutton]
- [GCE] Allow routing\_mode=None in ex\_create\_network (GITHUB-1217) [Daniel Hunsaker]
- [OpenStack] Implement Glance Image API v2 (GITHUB-1151) [Rick van de Loo]
- [OpenStack] Fix spelling in ex\_files description (GITHUB-1197) [Ken Dreyer]
- [OpenStack v2] Allow listing image members (GITHUB-1172) [Rick van de Loo]
- [OpenStack v2] Allow creating and accepting image members (GITHUB-1176) [Rick van de Loo]
- [OpenStack v2] Fix image members methods (GITHUB-1190) [Rick van de Loo]
- [OpenStack] Fix API doc for delete\_floating\_ip (GITHUB-1218) [Ken Dreyer]
- [OpenStack] Implement port attaching/detaching (GITHUB-1225) [Rick van de Loo]
- [OpenStack] Add methods for getting and creating ports (GITHUB-1226) [Alexander Grooff]
- [OpenStack] Add get\_user method (GITHUB-1216) [Ken Dreyer]
- [OpenStack] Add ex\_list\_subnets to OpenStack\_2\_NodeDriver (GITHUB-1215, LIBCLOUD-604) [Miguel Caballer]
- [OpenStack] The OpenStack\_2\_NodeDriver uses two connections (GITHUB-1215, LIBCLOUD-997) [Miguel Caballer]
- [OpenStack] The OpenStack\_2\_NodeDriver /v2.0/networks instead of /os-networks (GITHUB-1215, LIBCLOUD-998) [Miguel Caballer]
- [Scaleway] New Scaleway driver (GITHUB-1121, GITHUB-1220) [Daniel Hunsaker, Nándor István Krácser, Rémy Léone]
- [Scaleway] Update Scaleway default API host (GITHUB-1239) [Rémy Léone]

#### **DNS**

• [Google Cloud DNS] Document driver instantiation (GITHUB-1198) [Gareth McFarlane]

- Update docstring for storage provider class (GITHUB-1201) [Clemens Wolff]
- [Azure Blob Storage] Allow filtering lists by prefix (LIBCLOUD-986, GITHUB-1193) [Joshua Hawkinson]
- [Azure Blob Storage] Update driver documentation (GITHUB-1208) [Clemens Wolff]
- [Azure Blob Storage] Fix upload/download streams (GITHUB-1231) [Michael Perel]
- [Azure Blob Storage] Fix PageBlob headers (GITHUB-1237) [Andreas Hasenack]
- [S3] Guess s3 upload content type (LIBCLOUD-958, GITHUB-1195) [Iuri de Silvio]
- [S3] Add Amazon S3 (cn-northwest-1) Storage Driver (GITHUB-1241) [@yangkang55]

#### Other

• Fixed spelling in 2.0 changes documentation (GITHUB-1228) [Jimmy Casey]

## Changes in Apache Libcloud 2.3.0

- Drop support for Python 2.6 and Python 3.3 They're no longer supported, and the Python ecosystem is starting to drop support: two of our test dependencies no longer support them. [Quentin Pradet]
- Made pytest-runner optional (GITHUB-1167) [Vlad Glagolev]

#### Common

- Improve warning when CA\_CERTS\_PATH is incorrectly passed as a list (GITHUB-1118) [Quentin Pradet]
- Cleaned up and corrected third-party drivers documentation (GITHUB-1148) [Daniel Hunsaker]
- Modernized a few Python examples (GITHUB-1164) [Batuhan Osman Taşkaya]
- [OpenStack] Authentify with updated Identity API (LIBCLOUD-965, GITHUB-1145) [Miguel Caballer]

# Compute

- Fix "wait\_until\_running() method so it also works correctly and doesn't append "None" to the addresses list if node has no IP address. (GITHUB-1156, LIBCLOUD-971) [Tobias Paepke]
- [ARM] Fix checking for "location is None" in several functions (LIBCLOUD-926, GITHUB-1098) [Sameh Elsharkawy]
- [ARM] Fix error when using SSH key auth with Python 3 (GITHUB-1098) [Sameh Elsharkawy]
- [ARM] Fix API call on powerOff, understand PAUSED state (GITHUB-1003) [Markos Gogoulos]
- [ARM] Delete VHDs more reliably in destroy\_node(), raise exception on unhandled errors (GITHUB-1120) [Lucas Di Pentima]
- [ARM] Fix api version used to list and delete NICs (GITHUB-1128) [Peter Amstutz]
- [ARM] Allow faster list\_nodes() with ex\_fetch\_power\_state=False (GITHUB-1126) [Peter Amstutz, Lucas Di Pentima]
- [ARM] Fix delete\_old\_vhd (GITHUB-1137) [Peter Amstutz, Lucas Di Pentima]

- [ARM] Limit number of retries in destroy\_node (GITHUB-1134) [Peter Amstutz, Lucas Di Pentima]
- [ARM] Fix Retry-After header handling (GITHUB-1139) [Lucas Di Pentima]
- [CloudStack] Handle NICs without addresses (GITHUB-1141) [Pierre-Yves Ritschard]
- [CloudStack] Add change size and restore (LIBCLOUD-975, GITHUB-1166) [Mauro Murari]
- [Digital Ocean] Add ex\_enable\_ipv6 in DigitalOcean\_v2 driver (GITHUB-1130) [Rick van de Loo]
- [Digital Ocean] Add support for tags in list\_nodes() (LIBCLOUD-967, GITHUB-1149) [Mike Fischer]
- [Digital Ocean] Add rebuild and resize commands (LIBCLOUD-977, GITHUB-1169) [Adam Wight]
- [EC2] Add new x1.16xlarge and x1e.32xlarge instance type. (GITHUB-1101) [Anthony Monthe]
- [EC2] Add AWS EC2 c5 series (GITHUB-1147) [Anthony Monthe]
- [EC2] Add AWS EC2 M5 sizes (GITHUB-1159) [Anthony Monthe]
- [EC2] Update pricing information for EC2 instances. [Tomaz Muraus]
- [EC2] Allow cn-north-1 even without pricing information (LIBCLOUD-954, GITHUB-1127) [Quentin Pradet]
- [EC2] Fix EBS volume encryption (GITHUB-1008) [Sergey Babak]
- [ECS Aliyun] Support modify\_security\_group\_attributes (GITHUB-1157) [Zhang Yiming]
- [GCE] Allow adding labels to images (GITHUB-1138) [Katriel Traum, Eric Johnson]
- [GCE] Allow adding license strings to images (GITHUB-1136) [Katriel Traum, Eric Johnson]
- [GCE] Support GCE node labels. (LIBCLOUD-934, GITHUB-1115) [@maxlip]
- [GCE] Fix GCEList pagination. (GITHUB-1095) [Yap Sok Ann]
- [GCE] Allow setting service account in instance templates (LIBCLOUD-947, GITHUB-1108) [Evan Carter]
- [GCE] Add support for private IP addresses in GCE instance creation (LIBCLOUD-944, GITHUB-1107) [Gareth Mcfarlane]
- [GCE] Allow for use of shared network (VPC) and subnetwork (GITHUB-1165) [Boris Chazalet]
- [GCE] Add support for accelerators (LIBCLOUD-963, GITHUB-1163) [Michael Johnson]
- [ProfitBricks] Update driver and add support for the new API v4. (GITHUB-1103) [Nurfet Becirevic]
- [ProfitBricks] Fix list\_snapshots() method (GITHUB-1153) [Chad Phillips]
- [UpCloud] New driver for UpCloud (LIBCLOUD-938, GITHUB-1102) [Mika Lackman, Ilari Mäkelä]
- [UpCloud] Use disk size and storage tier also when creating node from template (LIBCLOUD-952, GITHUB-1124) [Mika Lackman]
- [UpCloud] Allow to define hostname and username (LIBCLOUD-951, LIBCLOUD-953, GITHUB-1123, GITHUB-1125) [Mika Lackman]
- [UpCloud] Add pricing information to list\_sizes (LIBCLOUD-969, GITHUB-1152) [Mika Lackman]

- Added Digital Ocean Spaces driver (LIBCLOUD-955, GITHUB-1129) [Andrew Starr-Bochicchio]
- [Digital Ocean Spaces] Add support for AMS3 region (GITHUB-1142) [Andrew Starr-Bochicchio]
- [Digital Ocean Spaces] Add support for SGP1 region (GITHUB-1168) [Andrew Starr-Bochicchio]

- Fix a bug / regression which resulted in increased memory consumption when using download\_object method. This method would store whole object content in memory even though there was no need for that.
  - This regression was introduced in 2.0.0 when we moved to using requests library. (GITHUB-1132) [Quentin Pradet]
- Fix a regression with hash computation performance and memory usage on object upload inadvertently introduced in 2.0.0 and make it more efficient. (GITHUB-1135) [Quentin Pradet]

### Changes in Apache Libcloud 2.2.1

#### Common

• Fix an issue with installation failing on some operating system and file systems combinations (e.g. ecryptfs layered on top of ext4) which don't support file names longer than 143 characters. (LIBCLOUD-946, GITHUB-1112)

Reported by Cyrille Verrier. [Tomaz Muraus]

### Compute

- [EC2] add g3 instance types [GITHUB-1101] (@zulupro)
- [EC2] add 'end' to ec2 reserved\_node [GITHUB-1099] (@xofer)
- Decrease sleep delay (from 1.5 to 0.2 seconds) inside paramiko client which is used to prevent busy waiting while waiting for data on the channel.
  - This should cause deploy scripts which produce a lot of output in incremental manner to finish faster. [Tomaz Muraus]
- Fix a regression in the Azure ARM driver which didn't allow custom storage URI suffix to be used with create\_node. (GITHUB-1110) [Lucas Di Pentima]

#### **Tests**

 Make sure we normalize header values and cast all the numbers to strings in base connection classes used by tests. (LIBCLOUD-945, GITHUB-1111)

Reported by Erich Eckner. [Tomaz Muraus]

### Changes in Apache Libcloud 2.2.0

# Compute

- [EC2] add g3 instance types [GITHUB-1101] (@zulupro)
- [EC2] add 'end' to ec2 reserved\_node [GITHUB-1099] (@xofer)

## Changes in Apache Libcloud 2.2.0

#### Common

• [GCE] Scrape prices for GCE Australia Region [GITHUB-1085] (Francisco Ros)

# Compute

- [ARM] Add option to create static public IP [GITHUB-1091, LIBCLOUD-918] (Aki Ketolainen)
- [SOFTLAYER] Add get\_image method to class [GITHUB-1066] (Francois Regnoult)
- [ARM] Add Storage support, volumes, snapshots [GITHUB-1087] (Sergey Babak)

#### Container

• [DOCKER] Fixes to support TLS connection [GITHUB-1067] (johnnyWalnut)

#### **DNS**

- [ROUTE53] Fix for TXT and SPF records, when user didn't escapsulate data in quotes, the API would fire error. As reported by @glyph [LIBCLOUD-875, GITHUB-1093] (Anthony Shaw)
- [LINODE] Add priority to the extra dictionary in record instances [GITHUB-1088] (@mete0r)

### **Load Balancer**

 Fixed AWS ALB/ELB driver init method to instantiate nested connection object properly [LIBCLOUD-936, GITHUB-1089] (Anton Kozyrev)

#### **Storage**

- [CLOUDFILES] Update OpenStackSwiftConnection to work with auth version 3.0 [GITHUB-1068] (Hakan Carlsson)
- [CLOUDFILES] Add SSL URI support [GITHUB-1076, LIBCLOUD-458] (@ayleph)

#### Changes in Apache Libcloud 2.1.0

## Common

- [AWS] Update prices and fix some region names [GITHUB-1056] (Francisco Ros)
- Fix bug in utils.decorators wrap exception method, used by vsphere driver [GITHUB-1054] (Anthony Shaw)
- Use PyTest as the unit testing runner (Anthony Shaw)
- Use of LXML is now disabled by defalt, use libcloud.utils.py3.DEFAULT\_LXML = True to reenable. LXML has compatibility issues with a number of drivers and etree is a standard package. [GITHUB-1038] (Anthony Shaw)

 Switch RawResponse class to use content body instead of text body, up to 10x performance improvement for methods like StorageDriver.download\_object [GITHUB-1053] (Quentin Pradet)

### Compute

- [OPENSTACK] Add support for Nova 2.x and Keystone 3 [GITHUB-1052] (Anthony Shaw)
- [GCE] Add loadBalancingScheme parameter for ex\_create\_forwarding\_rule method in GCE driver. [GITHUB-1079] (@sT331h0rs3)
- [GCE] Fix error codes not being parsed in certain scenarios [GITHUB-1074, LIBCLOUD-925] (micafer)
- [EC2] Fix node's Block Device Mapping was parsed from incorrect mapping. EbsInstanceBlockDevice is different from EbsBlockDevice. [GITHUB-1075] (Gennadiy Stas)
- [GANDI] Fixes the location name in image and instance type classes [GITHUB-1065] (Sayoun)
- [GCE] Fix method for create instance properties, it previously ignored the disk type parameter and defaulted to pd-standard. [GITHUB-1064] (Evan Carter)
- Fix missing return data from EC2 billing product methods [GITHUB-1062] (Alex Misstear)
- Handle [VULTR] API rate limiting [GITHUB-1058] (Francisco Ros)
- Fix Kili driver not correctly fixing the auth version for openstack to 2.0\_password [GITHUB-1054] (Anthony Shaw)
- [EC2] Add i3 instance types for AWS [GITHUB-1038] (Stephen Mullins)
- [VULTR] Extend extra dict of Vultr sizes to include additional fields (plan\_type and available\_locations) [GITHUB-1044] (Francisco Ros)

#### Container

- New driver for Google Container Engine [GITHUB-1059] (Andy Maheshwari)
- [KUBERNETES] Fix get\_container method responding with None [GITHUB-1054] (Anthony Shaw)
- [DOCKER] Fix for start\_container method [GITHUB-1049] (@johnnyWalnut)
- [DOCKER] fix add an extra check otherwise list\_containers breaks with AttributeError when fromImages is specified [GITHUB-1043] (@johnnyWalnut)

### Storage

• [S3] Fix raise in s3.upload\_object\_via\_stream [LIBCLOUD-914, GITHUB-1055] (Quentin Pradet)

### Changes in Apache Libcloud 2.0.0

#### Common

• Fix OpenStack drivers not correctly setting URLs when used with identity API, would default to 127.0.0.1 and service catalog URLs were not adhered to. [GITHUB-1037, LIBCLOUD-912, LIBCLOUD-904] (Anthony Shaw)

- Fix Aliyun ECS, Load balancer and storage adapters when using unicode UTF-8 characters in the names of resources in 2.0.0rc2 < it would fail as a MalformedResponseError, Python 2.7 element tree was raising a unicode error [GITHUB-1032] [GITHUB-994] (Anthony Shaw)
- Refactor the test classes to use the full libcloud.http and libcloud.common.base modules, with Connection, Response all used with requests\_mock. This increases our test coverages and catches bugs in drivers' custom parse\_body and auth modules [GITHUB-1031] (Anthony Shaw)
- Rename libcloud.httplib ssl to libcloud.http now that we don't use httplib [GITHUB-1028] (Anthony Shaw)

### Compute

- [GOOGLE] Add test to check that can create a GCE volume at a given location [GITHUB-1048] (Francisco Ros)
- [GOOGLE] Fix GCENodeDriver.ex\_get\_volume() when zone param is of class GCEZone or NodeLocation [GITHUB-1047] (Francisco Ros)
- [GOOGLE] Fix call to GCENodeDriver.\_ex\_populate\_volume\_dict [GITHUB-1046] (Francisco Ros)
- [ARM] Add support for Azure Cloud Environments as well as Locations [GITHUB-969] (Peter Amstutz)
- [EC2] Add support for ModifyVolume and DescribeVolumesModifications [GITHUB-1036] (Hennadii Stas)
- [ARM] Fix string representation of the VhdImage type and fix listing of Public IP addresses [GITHUB-1035] (Anthony Shaw)
- [GOOGLE] Remove validation checks for guestOsFeatures [GITHUB-1034] (Max Illfelder)
- [VSPHERE] Fix issue with authentication methods crashing [GITHUB-1031] (Anthony Shaw)
- [ARM] Add network security groups to azure ARM [GITHUB-1033] (Joseph Hall)
- [ARM] Add the ability to list resource groups [GITHUB-1032] (Joseph Hall)
- Add 1&1 compute driver [LIBCLOUD-911] [GITHUB-1029] (Jasmin Gacic)
- Fix Azure ARM driver condition for ex\_list\_publishers where location is specified [GITHUB-1030] (Joseph Hall)
- Added Import Snapshot and Describe Import Snapshot to EC2 compute driver [GITHUB-1023] (Nirzari Iyer)
- Add price\_monthly extra param to digitalocean sizes [GITHUB-1021] (Francisco Ros)
- Add aliyun ecs instance join leave security group [GITHUB-992] (Jie Ren)
- Add keypair management to OnApp driver [GITHUB-1018] (Tinu Cleatus)
- Add missing regions in AWS storage and compute drivers [GITHUB-1019] (Alex Misstear)
- Add SR-IOV net support to images in EC2 compute driver [GITHUB-1020] (Alex Misstear)
- Fix update t2.small image size from 11 CPU to 1 [GITHUB-1022] (Francisco Ros)
- Added Billing Product for image in EC2 compute driver [GITHUB-1024] (Nirzari Iyer)

#### **DNS**

• Add OnApp driver [GITHUB-1017] [LIBCLOUD-907] (Tinu Cleatus)

## Changes in Apache Libcloud 2.0.0rc2

#### Common

- Fix LIBCLOUD\_DEBUG trying to decompress already decompressed responses [LIBCLOUD-910] (Anthony Shaw)
- Added an integration test API and a test suite for validating functionality without mocking any libeloud subsystems [GITHUB-970] (Anthony Shaw)
- Fix for Linode classes since 2.0x [GITHUB-1026] (Anthony Shaw)
- Fix CertificateConnection not correctly signing requests in 2.0rc1, impacted Azure classic driver, OpenStack and Docker driver [GITHUB-1015] (Anthony Shaw)
- Change Cloudscale to cloudscale.ch. [GITHUB-993] (David Halter)
- Explicitly check if response is None in RawResponse class [GITHUB-1006] [LIBCLOUD-901] (Richard Xia)

### Compute

- Outscale SAS doc improvements and logo update [GITHUB-950] (Javier M Mellid)
- [GCE] Allow preemptible instances to be created [GITHUB-954] (John Baublitz)
- Add support for forcing detachment of EBS volumes to EC2 driver [GITHUB-1007] (Sergey Babak)
- Fix Public IP not assigned when creating NIC on Azure ARM [GITHUB-1013] [LIBCLOUD-906] (Simone Ripamonti)
- [ONAPP] Add list images support for OnApp driver [GITHUB-1011] (Tinu Cleatus)
- [EC2] Add r4 instance types for AWS [GITHUB-997] (Jens Deppe)
- [EC2] support for AWS eu-west-2 and ca-central-1 regions [GITHUB-1009] (Marat Komarov)
- [EC2] Add P2 GPU instance types [GITHUB-996] (MJK)
- [EC2] Add method to modify snapshot attribute for EC2 [GITHUB-990] (Sayan Chowdhury)
- [Linode] Add start, stop instance methods and fix incorrect state TERMINATED to STOPPED [GITHUB-986] (Markos Gogoulos)
- [EC2] Add ENA support for EC2 compute images [GITHUB-983] (Alex Misstear)
- [Azure ARM] fix typeerror on ex\_list\_nics [GITHUB-979] (Choi Jongu)
- [GCE] allow delete instances from managed group [GITHUB-975] (@zacharya19)

### **Storage**

• Reintroduce S3 multipart upload support with signature v4 [GITHUB-1005] [LIBCLOUD-834] (Alex Misstear)

#### Changes Apache Libcloud 2.0.0rc1

#### Common

• Fix DEBUG mode, also add support for using io.StringIO as the file handle when calling libcloud.enable\_debug. (GITHUB-978, LIBCLOUD-887) [Anthony Shaw]

- Introduction of the requests package as the mechanism for making HTTP requests for all drivers. (GITHUB-928) [Anthony Shaw]
- Fix bug where custom port and secure flag would not get propagated to connection class. (GITHUB-972) [Anthony Shaw]
- Fix bug where custom port would not get propagated to connection. (GITHUB-971) [Anthony Shaw]
- Fix bug where instantiating a connection from URL and then requesting an action with a leading / would lead to a malformed URL. (GITHUB-976) [Anthony Shaw]

### Compute

- Fix a bug in profitbricks driver where listing snapshots would request a malformed URL. [GITHUB-976] (Anthony Shaw)
- Fix LIBCLOUD-806 bug where vsphere driver cannot be instantiated. (GITHUB-967) [Anthony Shaw]
- [google compute] Improve performance of list nodes by caching volume information. (GITHUB-813, LIBCLOUD-826) [Tom Melendez]

# Changes in Apache Libcloud 1.5.0

#### Common

Set Dimension Data compute, backup and load balancer to default to 2.4 API. (GITHUB-961) [Samuel Chong]

## Compute

- [azure] New method for accessing rate cards. (GITHUB-957) [Soren L. Hansen]
- [gce] Allow multiple preemptible instances to be created. (GITHUB-954) [John Baublitz]
- [openstack] Add new Connection class to support VOMS proxys to keystone servers. (GITHUB-959) [micafer]
- [outscale] Added support for changed API for describing quotas. (GITHUB-960) [Javier M. Mellid]
- [ec2] Added m4 instances to us-gov and brazil, added m4.16xlarge to all. (GITHUB-964) [Matthew Tyas]
- Add new CloudScale.ch driver (GITHUB-951) [Dave Halter]
- [google compute] Bug fix for ex\_create\_multiple\_nodes Google Cloud disk auto delete. (GITHUB-955) [John Baublitz]
- [google compute] Add "MULTI\_IP\_SUBNET" guestOsFeatures option. (GITHUB-956) [Max Illfelder]
- [dimensiondata] Added support for 2.4 API, added support for image import, cloning. Add feature for changing NIC VLANs, add feature for changing NIC order for a server. (GITHUB-953) [Samuel Chong]
- [ec2] Add US-EAST2 (Ohio). (GITHUB-946) [Matthew Harris]
- [google compute] Fix to allow multiple node creation with subnets. (GITHUB-949) [John Baublitz]

#### Container

• [rancher] The scheme (secure) and port no longer need to be explicitly specified, allowing a user to simply copy in the string provided to them from Rancher. (GITHUB-958) [Matthew Ellison]

## Changes in Apache Libcloud 1.4.0

### Compute

- Introduce new Azure ARM driver. [Peter Amstulz]
- [ec2] Fix the bug that created the node at ecs driver and implement the method for creating public ip. (GITHUB-943) [watermelo]
- [profitbricks] changes to the ProfitBricks compute driver to drop support for the old SOAP api (now end of life) and provide support for v3 of the REST api. (GITHUB-938) [Matt Finucane]
- [cloudsigma] Added Warsaw (waw) region. (GITHUB-942) [Kamil Chmielewski]
- [google compute] List images fix for projects > 500 images. (GITHUB-939) [Scott Crunkleton]
- [ec2] Add st1 and sc1 volume types to valid types. (GITHUB-925) [Sean Goller]
- [digital ocean] add ex\_change\_kernel in DigitalOcean\_v2 driver. (GITHUB-922) [Rick van de Loo]
- [digital ocean] add ex\_hard\_reboot in DigitalOcean\_v2 driver. (GITHUB-920) [Rick van de Loo]
- [openstack] add ex\_start\_node for the openstack driver. (GITHUB-919) [Rick van de Loo]
- [vultr] Extra Attributes for Node Creation on Vultr. (GITHUB-917) [Fahri Cihan Demirci]
- [vultr] Implement SSH Key Create/Delete Methods for Vultr. (GITHUB-914) [Fahri Cihan Demirci]
- [dimension data] No longer throw error when powering off a node that is already stopped. (GITHUB-912) [Samuel Chong]
- [dimension data] Refactor create\_node for MCP2 to support CaaS API 2.3 feature. Can now specify Network Adapter Name for primary and additional NIC. Parameters in create\_node function is tailored for MCP2. (GITHUB-902) [Samuel Chong]
- Volume snapshot operations, i.e. creating, listing and deleting volume snapshots, for the Digital Ocean driver. (LIBCLOUD-861, GITHUB-909) [Fahri Cihan Demirci]
- Added snapshot management to OVH compute. (GITHUB-897) [Anthony Monthe]
- [GCE] Support for HTTP(S) proxies with BackendServices. (GITHUB-856) [Tom Melendez]

#### Container

• [docker] As reported in the corresponding bug, the docker daemon will respond in an install\_image call with all the messages produced during the procedure parsed as json docs. In that case the response headers also contain the value 'transfer-encoding':'chunked'. That kind of response can now be parsed properly by the DockerResponse parse\_body method. Also, another small change is that previously the id of the new image was marked in the json document as id, but now it's marked as sha256, so the regex used to discover the id has been updated. (GITHUB-918) [Pavlos Tzianos]

#### **Load Balancing**

- Introduce AWS Application Load Balancer (ALB) driver. (LIBCLOUD-869, GITHUB-936) [Anton Kozyrev]
- Fix bug where GCE Load balancer supposes that all VMs have public ips. (LIBCLOUD-879, GITHUB-952) [Chris Walker]

- [s3] Add AP-Southeast2 as region.
- [google] Prevent GCE auth to hide S3 auth. (GITHUB-921) [Quentin Pradet]
- [GCS] Fixed some google\_storage.py URL cleaning. (GITHUB-901) [Scott Crunkleton]

### Changes in Apache Libcloud 1.3.0

#### General

- Introduced new base API for instantiating drivers. (GITHUB-822) [Anthony Shaw]
- Added certificate path for SLES12/OpenSUSE12. (GITHUB-884) [Michael Calmer]
- Deprecate DigitalOcean v1 API support in favour of v2 API. (GITHUB-889, GITHUB-892) [Andrew Starr-Bochicchio]
- Deprecate RunAbove cloud drivers in favour of new OVH cloud driver. (GITHUB-891) [Anthony Monthe]

# Compute

- Fix reporting function for detailed admin logs in Dimension Data Driver. (GITHUB-898) [Anthony Shaw]
- Added edit firewall functionality to Dimension Data driver. (GITHUB-893) [Samuel Chong]
- Bugfix Fixed listing nodes issue in Python 3. (LIBCLOUD-858, GITHUB-894) [Fahri Cihan Demirci]
- Added FCU (Flexible Compute Unit) support to the Outscale driver. (GITHUB-890) [Javier M. Mellid]
- [google compute] Add "WINDOWS" guestOsFeatures option. (GITHUB-861) [Max Illfelder]
- When creating volumes on OpenStack with defaults for *location* or *volume\_type*, newer OpenStack versions would throw errors. The OpenStack driver will now only post those arguments if non-*NoneType*. (GITHUB-857) [Allard Hoeve]
- When fetching the node details of a non-existing node, OpenStack would raise a *BaseHTTPError* instead of returning *None*, as was intended. Fixed tests and code. (GITHUB-864)
- Added ex stop node to the OpenStack driver. (GITHUB-865) [Allard Hoeve]
- When creating volume snapshot, the arguments *name* and *description* are truely optional when working with newer OpenStack versions. The OpenStack driver will now only post thost arguments if they are non-*NoneType*. (GITHUB-866) [Allard Hoeve]
- Storage Volume Snapshot now has an attribute *name* that has the name of the snapshot if the provider supports it. This used to be .extra['name'], but that is inconsistent with Node and Storage Volume. The extra dict still holds name for backwards compatibility. (GITHUB-867) [Allard Hoeve]

#### Container

- Introduced new Rancher driver (GITHUB-876) [Mario Loria]
- Fixed bug in Docker util library for fetching images from the docker hub API. API was returning 301 and redirects were not being followed. (GITHUB-862) [Anthony Shaw]

#### **Load Balancer**

• Added fetch tags support in elb driver. (GITHUB-848) [Anton Kozyrev]

# **Storage**

• Added storage permissions for Google Cloud Storage. (GITHUB-860) [Scott Crunkleton]

### Changes in Apache Libcloud 1.2.1

# **Backup**

 Fix issue enabling backups on Dimension Data driver. (GITHUB-858) [Mark Maglana, Jeff Dunham, Anthony Shaw]

#### Changes in Apache Libcloud 1.2.0

#### General

• Fix caching of auth tokens in the Google Compute Engine drivers. Now we make sure that the file is truncated before writing a new token. Not truncating the file would cause issues if the new token is shorted then the existing one which is cached in the file. (GITHUB-844, LIBCLOUD-835) [Paul Tiplady]

#### Compute

- [gce] Fix image undeprecation in GCE. (GITHUB-852) [Max Illfelder]
- [gce] Added Managed Instance Groups. (GITHUB-842) [Tom Melendez]
- [gce] Allow undeprecation of an image. (GITHUB-851) [Max Illfelder]
- [cloudstack] BUGFIX Values with wildcards failed signature validation. (GITHUB-846) [Ronald van Zantvoot]
- [cloudstack] Added StorageState-Migrating to the cloudstack driver. (GITHUB-847) [Marc-Aurèle Brothier]
- [google compute] Update copy image logic to match create image. (GITHUB-828) [Max Illfelder]
- Removed HD attribute from the Abiquo compute driver to support the 3.4 API. (GITHUB-840) [David Freed-man]
- Add image and size details to *list\_nodes* response in Dimension Data driver. (GITHUB-832) [Anthony Shaw]
- Add support for changing VM admin password in VMware driver. (GITHUB-833) [Juan Font Alonso]
- Add Barcelona (Spain) region to the Aurora Compute driver. (GITHUB-835) [Wido den Hollander]
- Various improvements in the libvirt driver. (GITHUB-838) [Rene Kjellerup]

#### **Load balancer**

• Add support for temporary IAM role credentials (token) to the AWS ELB driver. (GITHUB-843) [Anton Kozyrev]

#### **DNS**

- Updated the 'extra' parameter in *update\_record()* to be optional in aurora driver. (GITHUB-830) [Wido den Hollander]
- Support for iterating over records and zones in the Aurora DNS driver. (GITHUB-829) [Wido den Hollander]
- Add support for DS, PTR, SSFHFP and TLSA record type to the Aurora DNS driver. (GITHUB-834) [Wido den Hollander]

#### Container

• Add network mode and labels when creating containers within docker driver. (GITHUB-831) [Jamie Cressey]

## **Storage**

• Fix authentication issue in S3/China region, disabled multipart uploads as not supported by region. (GITHUB-839) [Luke Morfitt]

## **Changes with Apache Libcloud 1.1.0**

#### General

Add support for automatic SNI (SSL extension) using the hostname supplied to connect to.
 Note: This functionality is only available in Python 2.7.9 and Python >= 3.2. (LIBCLOUD-827, GITHUB-808)
 [David Freedman]

#### Compute

- Add support image guest OS features in GCE driver. (GITHUB-825) [Max Illfelder]
- Added forceCustimization option for vcloud director driver. (GITHUB-824) [Juan Font]
- Add node lookup by UUID for libvirt driver. (GITHUB-823) [Frank Wu]
- Add block storage support to DigitalOcean node driver. (GITHUB-807) [Adam Wolfe Gordon]
- Add SASL auth support to libvirt driver. (GITHUB-809) [Katana-Steel]
- Allow VIPs in Dimension Data driver to bind to any port. (GITHUB-818) [Mark Maglana]
- Add support for deleting a security group to the Aliyun ECS driver. (GITHUB-816) [Heng Wu]
- Add ex\_force\_customization argument to the ex\_deploy\_node in vCloud driver. (GITHUB-824) [Juan Font]
- Add support for listing attributes for a particular security group (ex\_list\_security\_group\_attributes) to the Aliyun ECS driver. (GITHUB-826) [Heng Wu]
- Add new Mumbai, India region to the EC2 driver. [Tomaz Muraus]
- Add driver for the new AWS cn-north-1 region. (GITHUB-827, LIBCLOUD-820) [Jamie Cressey]
- Fix authentication with temporary IAM role credentials (token) in the EC2 driver. (GITHUB-820) [Alejandro González]

#### Container

• Fixed API compatibility for Docker Container driver with API 1.24, set driver to use versioned URL for all communication. Backported changes to 1.21 API (GITHUB-821) [Anthony Shaw]

#### **Load Balancer**

• Added additional parameters to the Rackspace driver in *list\_balancers* for filtering and searching. (GITHUB-803) [João Paulo Raittes]

#### Changes with Apache Libcloud 1.0.0

#### General

- Fix a regression with timeout argument provided via \_ex\_connection\_class\_kwargs method being overriden with None inside the BaseDriver constructor method.
  - Reported by Jay Rolette. (GITHUB-755) [Tomaz Muraus, Jay Rolette]
- Fix OpenStack v3 authentication and allow user to provide a custom value for the OpenStack domain parameter. Previously only possible value as a default value of Default. (GITHUB-744) [Lionel Schaub]
- Add support for authenticating against Keystone and OpenStack based clouds using OpenID Connect tokens. (GITHUB-789) [Miguel Caballer]

### Compute

- GCE nodes can be launched in a subnetwork (GITHUB-783) [Lars Larsson]
- Add Subnetworks to GCE driver (GITHUB-780) [Eric Johnson]
- Fix missing pricing data for GCE (LIBCLOUD-713, GITHUB-779) [Eric Johnson]
- Add Image Family support for GCE (GITHUB-778) [Rick Wright]
- Fix a race condition on GCE driver *list\_nodes()* Invoking GCE's *list\_nodes()* while some VMs are being shutdown can result in the following *libcloud.common.google.ResourceNotFoundError* exception to be raised. (GITHUB-727) [Lénaïc Huard]
- Allow user to filter nodes by location by adding optional *location* argument to the *list\_nodes()* method in the CloudStack driver. (GITHUB-737) [Lionel Schaub]
- Fix OpenStack IP type resolution make sure IP addresses are correctly categorized and assigned on *private\_ips* and *public\_ips* Node attribute. (GITHUB-738) [Lionel Schaub]
- Add new Perth, Australia and Manila, Philippines region to the CloudSigma v2 driver. [Tomaz Muraus]
- Update libvirt driver so it returns false if a non-local libvirt URL is used (right now only local instances are supported). (LIBCLOUD-820, GITHUB-788) [René Kjellerup]
- Update libvirt driver to use *ip neight* command instead of *arp* to retrieve node MAC address if *arp* command is not available or the current user doesn't have permission to use it. (LIBCLOUD-820, GITHUB-788) [René Kjellerup]
- Update create\_volume method in the CloudStack driver and add ex\_volume\_type argument to it. If this argument is provided, a volume which names matches this argument value will be searched and selected among the available disk offerings. (GITHUB-785) [Greg Bishop]

- Add support for AWS signature v4 to the Outscale storage driver. (GITHUB-736) [Javier M. Mellid]
- Add new S3 RGW storage driver. (GITHUB-786, GITHUB-792) [Javier M. Mellid]

#### Loadbalancer

• Update AWS ELB driver to use signature version 4 for authentication. This way, the driver also work with the *eu-central-1* region. (GITHUB-796) [Tobias Paepke]

#### **DNS**

- Add BuddyNS driver. (GITHUB-742) [Oltjano Terpollari]
- Added DNSPod driver (https://www.dnspod.com). (GITHUB-787) [Oltjano Terpollari]

### Changes with Apache Libcloud 1.0.0-rc2

#### General

- Fix a bug with consuming stdout and stderr in the paramiko SSH client which would manifest itself under very rare condition when a consumed chunk only contained a single byte or part of a multi byte UTF-8 character. [Lakshmi Kannan, Tomaz Muraus]
- Increase default chunk size from 1024 to 4096 bytes in the paramiko SSH client. This results in smaller number of receive calls on the average. [Tomaz Muraus]
- Fix to Dimension Data API address for Middle-East and Africa (GITHUB-700) [Anthony Shaw]
- Addition of Dimension Data Australia federal government region to dimension data drivers. (GITHUB-700) [Anthony Shaw]
- Throw a more user-friendly exception on "No address associated with hostname". (GITHUB-711, GITHUB-714, LIBCLOUD-803) [Tomaz Muraus, Scott Crunkleton]
- Remove deprecated provider constants with the region in the name and related driver classes (e.g. EC2\_US\_EAST, etc.).
  - Those drivers have moved to single provider constant + region constructor argument model. [Tomaz Muraus]
- Introduce new *list\_regions* 'class method on the base driver class. This method is to be used with provider drivers which support multiple regions and region constructor argument. It allows users to enumerate available / supported regions. [Tomaz Muraus]

# **Compute**

- [dimension data] added support for VMWare tools VM information inside list\_nodes responses (GITHUB-734) [Jeff Dunham]
- [ec2] added ex\_encrypted and ex\_kms\_key\_id optional parameters to the create volume method (GITHUB-729) [Viktor Ognev]
- [dimension data] added support for managing host anti-affinity rules, added paging support to all supported calls and added support for requesting priority ordering when creating ACL rules (GITHUB-726) [Jeff Dunham]

- [openstack] when creating floating IPs, added pool\_id as an optional argument (GITHUB-725) [marko-p]
- [google compute] Added setMachineType method to allow for changing sizes of instances (GITHUB-721) [Eric Johnson]
- [google compute] allow bypassing image search in standard project list (GITHUB-713) [Max Illfelder]
- Add support for requesting a MKS token for accessing the remote console in VMware vCloud driver (GITHUB-706) [Juan Font Alonso]
- Add support in VMware vCloud driver for v5.5 API, with snapshot support (GITHUB-658) [Juan Font Alonso]
- Added support for adding a family to an image on Google Compute Driver (GITHUB-704) [Max Illfelder]
- Deprecated IBM SCE, HP Helion, OpSource, Ninefold and CloudFrames drivers, removed driver code and tests. (GITHUB-701, LIBCLOUD-801) [Anthony Shaw]
- Introduced error messages (*libcloud.compute.deprecated*) for deprecated drivers (GITHUB-701, LIBCLOUD-801) [Anthony Shaw]
- New Compute drivers- BSNL, Indosat, Med-1, NTT-America, Internet Solutions (GITHUB-700) [Anthony Shaw]
- Fix to set default signature version for AWS Seoul region to v4, removed non-supported size (hs1.xlarge) (GITHUB-684) [Geunwoo Shin]
- Support filtering by location in list\_nodes for dimension data compute driver fix lack of paging support (GITHUB-691) [Jeff Dunham]
- Support for filtering by IPv4, IPv6, network, network domain, VLAN in Dimension data driver. (GITHUB-694) [Jeff Dunham]
- Added *Node.created\_at* which, on supported drivers, contains the datetime the node was first started. (GITHUB-698) [Allard Hoeve] [Rick van de Loo]
- New driver for Aliyun Elastic Compute Service. (LIBCLOUD-802, GITHUB-712) [Sam Song, Heng Wu]

- Added Outscale storage driver (GITHUB-730) [Javier M. Mellid]
- Improvements to Google Auth for Storage and Compute and MIME bug fix (LIBCLOUD-800, GITHUB-689) [Scott Crunkleton]
- Implement get\_container, get\_object and upload\_object\_via\_stream methods in the Back-blaze B2 storage driver.
  - Note: Backblaze API doesn't upload streaming uploads so when using upload\_object\_via\_stream whole file is read and buffered in memory. (GITHUB-696) [Jay jshridha]
- New driver for Aliyun OSS Storage Service. (LIBCLOUD-802, GITHUB-712) [Sam Song]

### Loadbalancer

• New driver for Aliyun SLB Loadbalancer Service. (LIBCLOUD-802, GITHUB-712) [Sam Song]

#### **DNS**

- Added NearlyFreeSpeech.net (NSFN) driver [Ken Drayer] (GITHUB-733)
- Added Lua DNS driver [Oltjano Terpollari] (GITHUB-732)
- Added NSOne driver [Oltjano Terpollari] (GITHUB-710)
- Fix a bug in the GoDaddy driver make sure host attribute on the connection class is correctly set to the hostname. [Tomaz Muraus]
- Fix handling of MX records in the Gandi driver. (GITHUB-718) [Ryan Lee]

# **Backup**

• Dimension Data - added additional testing, fixed bug on client response naming, added support for adding backup clients to a backup enabled node. (GITHUB-692, GITHUB-693, GITHUB-695) [Jeff Dunham]

# Changes with Apache Libcloud 1.0.0-pre1

#### General

- Introduction of container based drivers for Docker, Rkt and Container-as-a-service providers (LIBCLOUD-781, GITHUB-666) [Anthony Shaw]
- Introduce a new libeloud.backup API for Backup as a Service projects and products. (GITHUB-621) [Anthony Shaw]
- Also retry failed HTTP(s) requests upon transient "read operation timed out" SSL error. (GITHUB-556, LIBCLOUD-728) [Scott Kruger]
- Throw a more user-friendly exception if a client fails to establish SSL / TLS connection with a server because of an unsupported SSL / TLS version. (GITHUB-682) [Tomaz Muraus]

#### Compute

- Add ap-northeast-2 region to EC2 driver (South Korea) (GITHUB-681) [Anthony Shaw]
- Added Added volume type to EC2 volume extra to EC2 driver. (GITHUB-680) [Gennadiy Stas]
- Add LazyObject class that provides lazy-loading, see *GCELicense* for usage (LIBCLOUD-786, GITHUB-665) [Scott Crunkleton]
- Added t2.nano instance type to EC2 Compute driver (GITHUB-663) [Anthony Shaw]
- Support for passing the image ID as a string instead of an instance of image when creating nodes in Dimension Data driver. (GITHUB-664) [Anthony Shaw]

### **DNS**

- Add support for 'health checks' in Aurora DNS driver (GITHUB-672) [Wido den Hollander]
- Make sure ttl attribute is correctly parsed and added to the Record extra dictionary. (GITHUB-675) [Wido den Hollander]
- Improve unit tests of Aurora DNS driver (GITHUB-679) [Wido den Hollander]

## Changes with Apache Libcloud 0.20.1

### Compute

• [google] Allow for old and new style service account client email address (LIBCLOUD-785) [Hoang Phan]

## Changes with Apache Libcloud 0.20.0

#### General

- Added .editorconfig file for easier editing (GITHUB-625) [Misha Brukman]
- Fix a bug with Libcloud accidentally setting paramiko root logger level to DEBUG (this should only happen if LIBCLOUD\_DEBUG environment variable is provided).
  - Reported by John Bresnahan. (LIBCLOUD-765) [Tomaz Muraus, John Bresnahan]
- Simply travis and tox config (.travis.yml, tox.ini). (GITHUB-608) [Anthony Monthe]
- Fixed Python2.6 unit testing (and Google Cloud Storage tests) (GITHUB-648) [Scott Crunkleton]

# **Compute**

- [google] Allow for old and new style service account client email address (LIBCLOUD-785) [Hoang Phan]
- Minor security improvement for storing cached GCE credentials (LIBCLOUD-718) [Siim Põder]
- Removed DreamHosts Compute Driver, DreamHosts users will now use the OpenStack Node driver since DreamHosts are OpenStack API compliant (GITHUB-655) [Stephano Maffulli]
- Added additional kwargs to the create\_node method for Dimension Data driver, allowing the user to specify the RAM and CPU upfront. Added a ex\_reconfigure\_node method and ex\_list\_customer\_images as well as updating the API to 2.1. (LIBCLOUD-783, GITHUB-656) [Anthony Shaw]
- The EC2 Instance Type updated with correct disk sizes (especially the disk size for the m3 instances), conversion errors between GiB an M[i]B, disk count were the cause. Added instance types g2.8xlarge and t2.large. (GITHUB-646) [Philipp Hahn]
- Add update node, update VMware tools, add storage, change storage size or speed, remove storage to Dimension Data Driver. (LIBCLOUD-775, GITHUB-644) [Anthony Shaw]
- Include 'service\_name' support in \_parse\_service\_catalog\_auth\_v3 for Openstack Drivers (GITHUB-647) [Steve Gregory]
- Outscale inc & sas driver update (GITHUB-645) [@LordShion]
- Add new *eu-west-2* & *us-east-2* regions to the OUTSCALE\_INC & OUTSCALE\_SAS drivers. [Filipe Silva /lordshion]
- [google compute] add pricing data update script (GITHUB-464) [Misha Brukman]
- Fix a bug in the list\_volumes method in the CloudStack driver so it returns an empty list if no volumes are found. (GITHUB-617) [Wido den Hollander]
- Return proper volume state for CloudStack volumes. (GITHUB-615, LIBCLOUD-764) [Wido den Hollander]
- Add support for multiple regions in Aurora compute driver (GITHUB-623) [Wido den Hollander]
- Fix value of node.extra['ip\_addresses'] node attribute in the CloudStack driver. (LIBCLOUD-767, GITHUB-627) [Atsushi Sasaki]

- Make sure that node.public\_ips attribute in the CloudStack driver doesn't contain duplicated values.. (LIBCLOUD-766, GITHUB-626) [Atsushi Sasaki]
- Allow user to wait for a resource to reach a desired state in the Dimension Data driver by using new ex\_wait\_for\_state method. (LIBCLOUD-707, GITHUB-631) [Anthony Shaw]
- Added M4 pricing and instance information to EC2 driver (GITHUB-634) [Benjamin Zaitlen]
- Added C4 instance information to EC2 driver (GITHUB-638) [amitofs]
- Allow location of the datacenter to be supplied in ProfitBricks driver (LIBCLOUD-771, GITHUB-635) [Joel Reymont]
- Reduce redundant API calls in CloudStack driver (LIBCLOUD-590, GITHUB-641) [Atsushi Sasaki]
- Add an additional argument to libcloud.compute.drivers.GCENodeDriver.create\_node to allow for creation of preemptible GCE instances (GITHUB-643) [@blawney]
- GoogleStorageDriver can now use either our S3 authentication or other Google Cloud Platform OAuth2 authentication methods. (GITHUB-633) [Scott Crunkleton]
- All NodeState, StorageVolumeState, VolumeSnapshotState and Provider attributes are now strings instead of integers. (GITHUB-624) [Allard Hoeve]

#### Loadbalancer

#### **DNS**

- RackSpace driver New DNS driver methods:
  - ex\_iterate\_ptr\_records
  - ex\_get\_ptr\_record
  - ex\_create\_ptr\_record
  - ex\_update\_ptr\_record
  - ex delete ptr record

This should cover all of the functionality offered by the Rackspace DNS API in regards to RDNS. (LIBCLOUD-780, GITHUB-652) [Greg Hill]

- Update create\_record in the WorldWideDNS driver so it automatically selects a slot if one is not provided by the user via extra['entry'] argument. (GITHUB-621) [Alejandro Pereira]
- Introduce GoDaddy DNS Driver with examples and documentation. (LIBCLOUD-772, GITHUB-640, LIBCLOUD-778) [Anthony Shaw]
- Add new driver for CloudFlare DNS (https://www.cloudflare.com/dns/). (GITHUB-637) [Tomaz Muraus]

# Changes with Apache Libcloud 0.19.0

#### General

- Update Rackspace AUTH\_URL (LIBCLOUD-738) [Brian Curtin]
- Fix LIBCLOUD\_DEBUG mode so it works on Python 3.x. [Tomaz Muraus]

- Fix Libcloud code so it doesn't throw an exception if simplejson < 2.1.0 is installed. (LIBCLOUD-714, GITHUB-577) [Erik Johnson]
- Fix endpoint URL for DimensionData Asia Pacific region. (GITHUB-585) [Anthony Shaw]
- Document potential time drift issue which could cause authentication in the GCE drivers to fail. (GITHUB-571) [Michal Tekel]
- Update documentation for EC2 make sure they reflect region changes from 0.14 release. (GITHUB-606) [James Guthrie]

### Compute

- Fixed malformed XML requests with Dimension Data driver. (LIBCLOUD-760, GITHUB-610) [Anthony Shaw]
- Update list of scopes for Google Compute Engine driver. (GITHUB-607) [Otto Bretz]
- Allow user to filter VPC by project in the CloudStack driver by passing project argument to the ex list vps method. (GITHUB-516) [Syed Mushtaq Ahmed]
- Add volume management methods and other various improvements and fixes in the RunAbove driver. (GITHUB-561) [Anthony Monthe]
- Add support and update Dimension Data driver to use API v2.0 by default. (LIBCLOUD-736, GITHUB-564) [Anthony Shaw]
- Add new ex\_virtual\_network\_name and ex\_network\_config argument to the create\_node'
  method in the Azure driver. With those arguments user can now specify which virtual network to use. (GITHUB569) [Jesaja Everling]
- Fix create\_node method in the GCE driver calling inexistent method (ex\_get\_disk instead of ex\_get\_volume). (GITHUB-574) [Alex Poms]
- Allow user to pass proxy\_url keyword argument to the VCloud driver constructor. (GITHUB-578) [Daniel Pool]
- Various fixes and improvements in the DimensionData driver (support for creating servers in MCP 1 and 2 data center, performance improvements in the location fetching, etc.). (GITHUB-587, GITHUB-593, LIBCLOUD-750, LIBCLOUD-753) [Anthony Shaw]
- Added ex\_assign\_public\_ip argument to create\_node in the EC2 driver. (GITHUB-590) [Kyle Long]
- Added ex\_terminate\_on\_shutdown argument to create\_node in the EC2 driver. (GITHUB-595) [Kyle Long]
- Various fixes and improvements in the ex\_authorize\_security\_group\_ingress in the CloudStack driver. (LIBCLOUD-749, GITHUB-580) [Lionel Schaub]
- Add pricing information for Softlayer. (LIBCLOUD-759, GITHUB-603) [David Wilson]
- Standardize VolumeSnapshot states into the state attribute. (LIBCLOUD-758, GITHUB-602) [Allard Hoeve]

# **Storage**

- Add support for sa-east-1 region to the Amazon S3 driver. (GITHUB-562) [Iuri de Silvio]
- Fix handling of binary data in Local storage driver on Python 3. Now the file which is to be written or read from is opened in the binary mode (b flag). (LIBCLOUD-725, GITHUB-568) [Torf]

#### Loadbalancer

Add a new driver for DimensionData load-balancing service (http://cloud.dimensiondata.com/). (LIBCLOUD-737, GITHUB-567) [Anthony Shaw]

#### **DNS**

- Update Google Cloud DNS API from 'v1beta1' to 'v1' (GITHUB-583) [Misha Brukman]
- Add new driver for AuroraDNS service. (GITHUB-562, LIBCLOUD-735) [Wido den Hollander]
- Fix "\_to\_record" in the Route53 driver make sure it doesn't throw if the record TTL is not available. [Tomaz Muraus]
- Add new driver for WorldWideDNS service (http://www.worldwidedns.net/home.asp). (GITHUB-566, LIBCLOUD-732) [Alejandro Pereira]
- Add new driver for DNSimple service (https://dnsimple.com/). (GITHUB-575, GITHUB-604, LIBCLOUD-739) [Alejandro Pereira, Patrick Humpal]
- Add new driver for PointDNS service (https://pointhq.com). (GITHUB-576, GITHUB-591, LIBCLOUD-740) [Alejandro Pereira]
- Add new driver for Vultr DNS service (https://www.vultr.com). (GITHUB-579, GITHUB-596, LIBCLOUD-745) [Alejandro Pereira, Janez Troha]
- Add new driver for Liquidweb DNS service (http://www.liquidweb.com/). (GITHUB-581, LIBCLOUD-746) [Oltjano Terpollari, Alejandro Pereira]
- Add new driver for Zonomi DNS hosting service (http://zonomi.com/). (GITHUB-582, LIBCLOUD-747) [Olt-jano Terpollari, Alejandro Pereira]
- Add new driver for Durable DNS service (https://durabledns.com/). (GITHUB-588, LIBCLOUD-748) [Oltjano Terpollari, Alejandro Pereira]

### Changes with Apache Libcloud 0.18.0

## General

- Use native ssl.match\_hostname functionality when running on Python >= 3.2 and only require backports.ssl\_match\_hostname dependency on Python versions < 3.2. [Tomaz Muraus]
- Add support for AWS Signature version 4.
  - Note: Currently only GET HTTP method is supported. (GITHUB-444) [Gertjan Oude Lohuis]
- Fix a bug in the debug mode logging (LIBCLOUD\_DEBUG). Logging to the debug file would throw an exception if the text contained non-ascii characters. [Tomaz Muraus]
- Fix a bug with connection code throwing an exception if a port was a unicode type and not a str or int. (GITHUB-533, LIBCLOUD-716) [Avi Weit]
- Update is\_valid\_ip\_address function so it also works on Windows. (GITHUB-343, GITHUB-498, LIBCLOUD-601, LIBCLOUD-686) [Nicolas Fraison, Samuel Marks]
- Add support for retrying failed HTTP requests.
  - Retrying is off by default and can be enabled by setting LIBCLOUD\_RETRY\_FAILED\_HTTP\_REQUESTS environment variable. (GITHUB-515, LIBCLOUD-360, LIBCLOUD-709)

• Fix a bug in consuming stdout and stderr strams in Paramiko SSH client. In some cases (like connecting to localhost via SSH), exit\_status\_ready gets set immediately even before the while loop to consume the streams kicks in. In those cases, we will not have consumed the streams at all. (GITHUB-558) [Lakshmi Kannan]

## **Compute**

- Google Compute now supports paginated lists including filtering. (GITHUB-491) [Lee Verberne]
- OpenStackNodeSize objects now support optional, additional fields that are supported in OpenStack 2.1: ephemeral\_disk, swap, extra. (GITHUB-488, LIBCLOUD-682) [Greg Hill]
- StorageVolume objects now have an attribute *state* that holds a state variable that is standardized state across drivers. Drivers that currently support the *state* attribute are OpenStack and EC2. StorageVolume objects returned by drivers that do not support the attribute will have a *state* of *None*. When a provider returns a state that is unknown to the driver, the state will be *UNKNOWN*. Please report such states. A couple of drivers already put state fields in the *extra* fields of StorageVolumes. These fields were kept for backwards-compatibility and for reference. (GITHUB-476) [Allard Hoeve]
- Storage Volume objects on EC2 and OpenStack now have a key called snapshot\_id in their extra dicts containing the snapshot ID the volume was based on. (GITHUB-479) [Allard Hoeve]
- OpenStack driver: deprecated ex\_create\_snapshot and ex\_delete\_snapshot in favor of create\_volume\_snapshot and destroy\_volume\_snapshot. Updated base driver method create\_storage\_volume argument name to be optional. (GITHUB-478) [Allard Hoeve]
- Add support for creating volumes based on snapshots to EC2 and OS drivers. Also modify signature of base NodeDriver.create\_volume to reflect the fact that all drivers expect a StorageSnapshot object as the snapshot argument. (GITHUB-467, LIBCLOUD-672) [Allard Hoeve]
- VolumeSnapshots now have a *created* attribute that is a *datetime* field showing the creation datetime of the snapshot. The field in VolumeSnapshot.extra containing the original string is maintained, so this is a backwardscompatible change. (GITHUB-473) [Allard Hoeve]
- Improve GCE create\_node, make sure ex\_get\_disktype function (GITHUB-448) [Markos Gogoulos]
- GCE driver fix to handle unknown image projects (GITHUB-447) [Markos Gogoulos]
- Allow user to pass ex\_blockdevicemappings argument to the create\_node method in the OpenStack driver. (GITHUB-398, LIBCLOUD-637) [Allard Hoeve]
- Fix list\_volume\_snapshots method in the EC2 driver so it comforms to the base API. (LIBCLOUD-664, GITHUB-451) [Allard Hoeve]
- Add volumes\_attached attibute to node.extra in the OpenStack driver. (LIBCLOUD-668, GITHUB-462) [Allard Hoeve]
- Add the following new methods to the Linode driver: ex\_list\_volumes, ex\_create\_volume, ex\_destroy\_volume. (LIBCLOUD-649, GITHUB-430) [Wojciech Wirkijowski]
- Add list\_volume\_snapshots method to the OpenStack driver. (LIBCLOUD-663, GITHUB-450) [Allard Hoeve]
- Add Site to Site VPN functionality to CloudStack driver. (GITHUB-465) [Avi Nanhkoesingh]
- Add affinity group support to CloudStack driver (LIBCLOUD-671, GITHUB-468) [Mateusz Korszun]
- Add a support for a new AWS Frankfurt, Germany region (eu-central-1) to the EC2 driver using AWS Signature v4. (GITHUB-444) [Gertjan Oude Lohuis, Tomaz Muraus]
- Allow Filtering in EC2 list images() driver (GITHUB-456, LIBCLOUD-667) [Katriel Traum]
- Add ex list ip forwarding rules() to CloudStack driver (GITHUB-483) [Atsushi Sasaki]

- Add AURORA compute driver (LIBCLOUD-641, GITHUB-477) [Wido den Hollander]
- Update ex\_describe\_tags method in the EC2 driver and allow user to list tags for any supported resource. Previously you could only list tags for a node or a storage volume. (LIBCLOUD-676, GITHUB-482) [John Kinsella]
- Various improvements in the HostVirual driver (code refactoring, support for managing "packages"). (LIBCLOUD-670, GITHUB-472) [Dinesh Bhoopathy]
- Add support for DigitalOcean API v2.0 while maintaining support for the old API v2.0.
  - Note: API v2.0 is now used by default. To use the old API v1.0, pass api\_version='1.0' argument to the driver constructor. (GITHUB-442) [Andrew Starr-Bochicchio]
- Add new d4. instance types to the EC2 driver. Also update EC2 pricing data. (GITHUB-490) [Tomaz Muraus]
- Add new driver for Microsft Azure Virtual Machines service. (LIBCLOUD-556, GITHUB-305, GITHUB-499, GITHUB-538) [Michael Bennett, davidcrossland, Richard Conway, Matt Baldwin, Tomaz Muraus]
- Fix VPC lookup method in CloudStack driver (GITHUB-506) [Avi Nanhkoesingh]
- Add new driver for the Dimension Data provider based on the OpSource driver. (LIBCLOUD-698, GITHUB-507, LIBCLOUD-700, GITHUB-513) [Anthony Shaw]
- Add "virtualmachine\_id" attribute to the CloudStackAddress class in the CloudStack driver. (LIBCLOUD-679, GITHUB-485) [Atsushi Sasaki]
- Allow user to pass filters via arguments to the ex\_list\_port\_forwarding\_rules in the CloudStack driver. (LIBCLOUD-678, GITHUB-484) [Atsushi Sasaki]
- Fix an issue with list\_nodes in the CloudSigma driver throwing an exception if a node in the list had a static IP. (LIBCLOUD-707, GITHUB-514) [Chris O'Brien]
- Don't throw an exception if a limit for a particular CloudStack resource is "Unlimited" and not a number. (GITHUB-512) [Syed Mushtaq Ahmed]
- Allow user to pass ex\_config\_drive argument to the create\_node method in the OpenStack driver. (LIBCLOUD-356, GITHUB-330) [Ryan Parrish]
- Add new driver for Cloudwatt (https://www.cloudwatt.com/en/) provider. (GITHUB-338) [Anthony Monthe]
- Add new driver for Packet (https://www.packet.com/) provider. (LIBCLOUD-703, GITHUB-527) [Aaron Welch]
- Update Azure VM pricing information and add information for new D instance types. (GITHUB-528) [Michael Bennett]
- Add ex\_get\_node and ex\_get\_volume methods to CloudStack driver. (GITHUB-532) [Anthony Monthe]
- Update CloudSigma driver so the "unavailable" and "paused" node state is correctly mapped to "error" and "paused" respectively. (GITHUB-517) [Chris O'Brien]
- Add SSH key pair management methods to the Gandi driver. (GITHUB-534) [Anthony Monthe]
- Add ex\_get\_node and ex\_get\_volume methods to Gandi driver. (GITHUB-534) [Anthony Monthe]
- Add fault attribute to the extra dictionary of the Node instance returned by the OpenStack driver. (LIBCLOUD-730, GITHUB-557) [Nick Fox]
- Add new driver for Onapp IaaS platform. (LIBCLOUD-691, GITHUB-502) [Matthias Wiesner]
- Allow user to inject custom data / script into the Azure node by passing ex\_custom\_data argument to the create\_node method. (LIBCLOUD-726, GITHUB-554) [David Wilson]

- Add ex\_create\_cloud\_service and ex\_destroy\_cloud\_service method to the Azure driver. (LIBCLOUD-724, GITHUB-551) [David Wilson]
- Add support for passing user data when creating a DigitalOcean node (ex\_user\_data argument). (LIBCLOUD-731, GITHUB-559) [David Wilson]
- Allow user to specify which arguments are passed to list\_nodes method which is called inside wait\_until\_running by passing ex\_list\_nodes\_kwargs argument to the wait\_until\_running method. (ex\_user\_data argument). (LIBCLOUD-723, GITHUB-548) [David Wilson]
- Allow user to pass ex\_volume\_type argument to the create\_volume method in the OpennStack driver. (GITHUB-553) [Rico Echwald-Tijsen]
- Add new driver for RunAbove (https://www.runabove.com) provider. (GITHUB-550) [Anthony Monthe]
- Fix a bug with exception being throw inside the CloudStack driver when the provider returned no error message in the body. (GITHUB-555) [Konstantin Skaburskas]
- Various improvements in the DigitalOcean driver:
  - Increase page size to API maximum.
  - Add ex\_create\_attr kwarg to create\_node method.
  - Update all the list\_\* methods to use paginated requests
  - Allow user to specify page size by passing ex\_per\_page argument to the constructor.

(LIBCLOUD-717, GITHUB-537) [Javier Castillo II]

### **Storage**

- Fix a bug with authentication in the OpenStack Swift driver. (GITHUB-492, LIBCLOUD-635) [Tom Fifield]
- Add AuroraObjects Storage Driver. (GITHUB-540, LIBCLOUD-719) [Wido den Hollander]

### Loadbalancer

Add a new driver for Softlayer load-balancing service (https://www.softlayer.com/load-balancing). (GITHUB-500, LIBCLOUD-688) [Avi Weit]

## **DNS**

- Fix a bug when a ZoneDoesntExist exception was thrown when listing records for a zone which has no records in the HostVirtual driver. (GITHUB-460) [Vanč Levstik]
- Correctly handle MX records priority in the Route53 driver. (GITHUB-469) [Vanč Levstik]
- Allow user to create an A record which points directly to the domain zone name in the Route53 driver. (GITHUB-469) [Vanč Levstik]
- Fix delete\_zone method in the HostVirtual driver. (GITHUB-461) [Vanč Levstik]
- Fix parsing of the record name in the HostVirtual driver. (GITHUB-461) [Vanč Levstik]
- Add new driver for DigitalOcean DNS service. (GITHUB-505) [Javier Castillo II]

## Changes with Apache Libcloud 0.17.0

#### General

• Use match\_hostname function from backports.ssl\_match\_hostname package to verify the SSL certificate hostname instead of relying on our own logic. (GITHUB-374) [Alex Gaynor]

## Compute

- Add new eu-west-2 & us-east-2 regions to the OUTSCALE\_INC & OUTSCALE\_SAS drivers. [Filipe Silva /lordshion]
- GCE driver updated to include ex\_stop\_node() and ex\_start\_node() methods. (GITHUB-442) [Eric Johnson]
- GCE driver now raises ResourceNotFoundError when the specified image is not found in any image project. Previously, this would return None but now raises the not-found exception instead. This fixes a bug where returning None caused ex\_delete\_image to raise an AttributeError. (GITHUB-441) [Eric Johnson]
- GCE driver update to support JSON format Service Account files and a PY3 fix from Siim Põder for LIBCLOUD-627. (LIBCLOUD-627, LIBCLOUD-657, GITHUB-438) [Eric Johnson]
- GCE driver fixed for missing param on ex\_add\_access\_config. (GITHUB-435) [Peter Mooshammer]
- GCE driver support for HTTP load-balancer resources. (LIBCLOUD-605, GITHUB-429) [Lee Verberne]
- GCE driver updated to make better use of GCEDiskTypes. (GITHUB-428) [Eric Johnson]
- GCE driver list\_images() now returns all non-deprecated images by default. (LIBCLOUD-602, GITHUB-423) [Eric Johnson]
- Improve GCE API coverage for create\_node(). (GITHUB-419) [Eric Johnson]
- GCE Licenses added to the GCE driver. (GITHUB-420) [Eric Johnson]
- GCE Projects support common instance metadata and usage export buckets. (GITHUB-409) [Eric Johnson]
- Improvements to TargetPool resource in GCE driver. (GITHUB-414) [Eric Johnson]
- Adding TargetInstances resource to GCE driver. (GITHUB-393) [Eric Johnson]
- Adding DiskTypes resource to GCE driver. (GITHUB-391) [Eric Johnson]
- Fix boot disk auto delete in GCE driver. (GITHUB-412) [Igor Bogomazov]
- Add Routes to GCE driver. (GITHUB-410) [Eric Johnson]
- Add missing ubuntu-os-cloud images to the GCE driver. (LIBCLOUD-632, GITHUB-385) [Borja Martin]
- Add new us-east-2 and us-east-3 region to the Joyent driver. (GITHUB-386) [Anthony Monthe]
- Add missing t2. instance types to the us-west-1 region in the EC2 driver. (GITHUB-388) [Matt Lehman]
- Add option to expunge VM on destroy in CloudStack driver. (GITHUB-382) [Roeland Kuipers]
- Add extra attribute in list\_images for CloudStack driver. (GITHUB-389) [Loic Lambiel]
- Add ex\_security\_group\_ids argument to the create\_node method in the EC2 driver. This way users can launch VPC nodes with security groups. (GITHUB-373) [Itxaka Serrano]
- Add description argument to GCE Network. (GITHUB-397) [Eric Johnson]
- GCE: Improve MachineType (size) coverage of GCE API. (GITHUB-396) [Eric Johnson]
- GCE: Improved Images coverage. (GITHUB-395) [Eric Johnson]

- GCE: Support for global IP addresses. (GITHUB-390, GITHUB-394) [Eric Johnson]
- GCE: Add missing snapshot attributes. (GITHUB-401) [Eric Johnson]
- AWS: Set proper disk size in c3.X instance types. (GITHUB-405) [Itxaka Serrano]
- Fix a bug with handling of the ex\_keyname argument in the Softlayer driver. (GITHUB-416, LIBCLOUD-647) [Dustin Oberloh]
- Update CloudSigma region list (remove Las Vegas, NV region and add new San Jose, CA and Miami, FL region). (GITHUB-417) [Viktor Petersson]
- Add ex\_get\_node method to the Joyent driver. (GITHUB-421) [Anthony Monthe]
- Add support for placement group management to the EC2 driver. (GITHUB-418) [Mikhail Ovsyannikov]
- Add new tok02 region to the Softlayer driver. (GITHUB-436, LIBCLOUD-656) [Dustin Oberloh]
- Add new Honolulu, HI endpoint to the CloudSigma driver. (GITHUB-439) [Stephen D. Spencer]
- Fix a bug with config\_drive attribute in the OpenStack driver. New versions of OpenStack now return a boolean and not a string. (GITHUB-433) [quilombo]
- Add support for Abiquo API v3.x, remove support for now obsolete API v2.x. (GITHUB-433, LIBCLOUD-652) [David Freedman]
- Allow rootdisksize parameter in create\_node CloudStack driver (GITHUB-440, LIBCLOUD-658) [Loic Lambiel]

- Allow user to pass headers argument to the upload\_object and upload\_object\_via\_stream method.
  - This way user can specify CORS headers with the drivers which support that. (GITHUB-403, GITHUB-404) [Peter Schmidt]
- Fix upload\_object\_via\_stream so it works correctly under Python 3.x if user manually passes an iterator to the method.
  - Also improve how reading a file in chunks works with drivers which support chunked encoding always try to fill a chunk with CHUNK\_SIZE bytes instead of directly streaming the chunk which iterator returns.
  - Previously, if iterator returned 1 byte in one iteration, we would directly send this as a single chunk to the API. (GITHUB-408, LIBCLOUD-639) [Peter Schmidt]

### Loadbalancer

• Updates to CloudStack driver. (GITHUB-434) [Jeroen de Korte]

#### **DNS**

- New driver for Softlayer DNS service. (GITHUB-413, LIBCLOUD-640) [Vanč Levstik]
- Fix a bug with ex\_create\_multi\_value\_record method in the Route53 driver only returning a single record. (GITHUB-431, LIBCLOUD-650) [Itxaka Serrano]

## Changes with Apache Libcloud 0.16.0

#### General

- Add new OpenStackIdentity\_3\_0\_Connection class for working with OpenStack Identity (Keystone) service API v3. [Tomaz Muraus]
- Add support for prettifying JSON or XML response body which is printed to a file like object when using LIBCLOUD\_DEBUG environment variable. This option can be enabled by setting LIBCLOUD\_DEBUG\_PRETTY\_PRINT\_RESPONSE environment variable. [Tomaz Muraus]
- Add support for using an HTTP proxy for outgoing HTTP and HTTPS requests. [Tomaz Muraus, Philip Kershaw]

## Compute

- Fix an issue with LIBCLOUD\_DEBUG not working correctly with the Linode driver. [Tomaz Muraus, Juan Carlos Moreno] (LIBCLOUD-598, GITHUB-342)
- Add new driver for VMware vSphere (http://www.vmware.com/products/vsphere/) based clouds. [Tomaz Muraus]
- Add two new default node states NodeState . SUSPENDED and NodeState . ERROR. [Tomaz Muraus]
- Fix to join networks properly in deploy\_node in the CloudStack driver. (LIBCLOUD-593, GITUHB-336) [Atsushi Sasaki]
- Create CloudStackFirewallRule class and corresponding methods. (LIBCLOUD-594, GITHUB-337) [Atsushi Sasaki]
- Add support for SSD disks to Google Compute driver. (GITHUB-339) [Eric Johnson]
- Add utility get\_regions and get\_service\_names methods to the OpenStackServiceCatalog class. [Andrew Mann, Tomaz Muraus]
- Fix a bug in ex\_get\_console\_output in the EC2 driver which would cause an exception to be thrown if there was no console output for a particular node.
  - Reported by Chris DeRamus. [Tomaz Muraus]
- Add ip address parameter in CloudStack driver create node method. (GITHUB-346) [Roeland Kuipers]
- Fix ParamikoSSHClient.run and deploy\_node method to work correctly under Python 3. (GITHUB-347) [Eddy Reyes]
- Update OpenStack driver to map more node states to states recognized by Libcloud. [Chris DeRamus]
- Fix a bug with ex\_metadata argument handling in the Google Compute Engine driver create\_node method. (LIBCLOUD-544, GITHUB-349, GITHUB-353) [Raphael Theberge]
- Add SSH key pair management methods to the Softlayer driver. (GITHUB-321, GITHUB-354) [Itxaka Serrano]
- Correctly categorize node IP addresses into public and private when dealing with OpenStack floating IPs. [Andrew Mann]
- Add new t2 instance types to the EC2 driver. [Tomaz Muraus]
- Add support for Amazon GovCloud to the EC2 driver (us-gov-west-1 region). [Chris DeRamus]
- Allow user to pass "gp2" for "ex\_volume\_type" argument to the create\_volume method in the EC2 driver.
   Reported by Xavier Barbosa. [Tomaz Muraus, Xavier Barbosa]

- Add new driver for ProfitBricks provider. (LIBCLOUD-589, GITHUB-352) [Matt Baldwin]
- Various improvements and bugs fixes in the GCE driver. For a list, see https://github.com/apache/libcloud/pull/360/commits (GITHUB-360) [Evgeny Egorochkin]
- Allow user to specify virtualization type when registering an EC2 image by passing virtualization\_type argument to the ex\_register\_image method. (GITHUB-361) [Andy Grimm]
- Add ex\_create\_image method to the GCE driver. (GITHUB-358, LIBCLOUD-611) [Katriel Traum]
- Add some methods to CloudStack driver: create\_volume\_snapshot, list\_snapshots, destroy\_volume\_snapshot create\_snapshot\_template, ex\_list\_os\_types) (GITHUB-363, LIBCLOUD-616) [Oleg Suharev]
- Added VPC support and Egress Firewall rule support fo CloudStack (GITHUB-363) [Jeroen de Korte]
- Add additional attributes to the extra dictionary of OpenStack StorageVolume object. (GITHUB-366) [Gert-jan Oude Lohuis]
- Fix create\_volume method in the OpenStack driver to return a created volume object (instance of StorageVolume) on success, instead of a boolean indicating operation success. (GITHUB-365) [Gertjan Oude Lohuis]
- Add optional project parameters for ex\_list\_networks() to CloudStack driver (GITHUB-367, LIBCLOUD-615) [Rene Moser]
- CLOUDSTACK: option to start VM in a STOPPED state (GITHUB-368) [Roeland Kuipers]
- Support "config\_drive" in the OpenStack driver. Allow users to pass ex\_config\_drive argument to the create\_node and ex\_rebuild\_node method. (GITHUB-370) [Nirmal Ranganathan]
- Add support for service scopes to the create\_node method in the GCE driver. (LIBCLOUD-578, GITHUB-373) [Eric Johnson]
- Update GCE driver to allow for authentication with internal metadata service. (LIBCLOUD-625, LIBCLOUD-276, GITHUB-276) [Eric Johnson]
- Fix a bug in Elasticstack node creation method where it would raise exceptions because of missing data in a response, and also fix pulling the IP from the proper data item. (GITHUB-325) [Michael Bennett]
- Fix a bug which prevented user to connect and instantiate multiple EC2 driver instances for different regions at the same time. (GITHUB-325) [Michael Bennett]
- Add methods in CloudStack driver to manage mutiple nics per vm. (GITHUB-369) [Roeland Kuipers]
- Implements VPC network ACLs for CloudStack driver. (GITHUB-371) [Jeroen de Korte]

- Fix a bug with CDN requests in the CloudFiles driver. [Tomaz Muraus]
- Fix a bug with not being able to specify meta\_data / tags when uploading an object using Google Storage driver. (LIBCLOUD-612, GITHUB-356) [Stefan Friesel]

### Loadbalancer

• Allow user to specify session affinity algorithm in the GCE driver by passing ex\_session\_affinity argument to the create\_balancer method. (LIBCLOUD-595, GITHUB-341) [Lee Verberne, Eric Johnson]

### **DNS**

• Various fixes in the Google DNS driver. (GITHUB-378) [Franck Cuny]

# Changes with Apache Libcloud 0.15.1

# **Compute**

- Allow user to limit a list of subnets which are returned by passing subnet\_ids and filters argument to the ex\_list\_subnets method in the EC2 driver. (LIBCLOUD-571, GITHUB-306) [Lior Goikhburg]
- Allow user to limit a list of internet gateways which are returned by passing gateway\_ids and filters argument to the ex\_list\_internet\_gateways method in the EC2 driver. (LIBCLOUD-572, GITHUB-307) [Lior Goikhburg]
- Allow user to filter which nodes are returned by passing ex\_filters argument to the list\_nodes method in the EC2 driver. (LIBCLOUD-580, GITHUB-320) [Lior Goikhburg]
- Add network\_association\_id to ex\_list\_public\_ips and CloudstackAddress object (GITHUB-327) [Roeland Kuipers]
- Allow user to specify admin password by passing ex\_admin\_pass argument to the create\_node method in the Openstack driver. (GITHUB-315) [Marcus Devich]
- Fix a possible race condition in deploy\_node which would occur if node is online and can be accessed via SSH, but the SSH key we want to use hasn't been installed yet.
  - Previously, we would immediately throw if we can connect, but the SSH key hasn't been installed yet. (GITHUB-331) [David Gay]
- Propagate an exception in deploy\_node method if user specified an invalid path to the private key file. Previously this exception was silently swallowed and ignored. [Tomaz Muraus]

#### **DNS**

• Include a better message in the exception which is thrown when a request in the Rackspace driver ends up in an ERROR state. [Tomaz Muraus]

## **Changes with Apache Libcloud 0.15.0**

#### General

- Use lxml library (if available) for parsing XML. This should substantially reduce parsing time and memory usage for large XML responses (e.g. retrieving all the available images in the EC2 driver). [Andrew Mann]
- Use -head flag instead of -X HEAD when logging curl lines for HEAD requests in debug mode.

Reported by Brian Metzler. (LIBCLOUD-552) [Tomaz Muraus]

- Fix Python 3 compatibility bugs in the following functions:
  - import\_key\_pair\_from\_string in the EC2 driver
  - publickey.\_to\_md5\_fingerprint
  - publickey.get\_pubkey\_ssh2\_fingerprint

(GITHUB-301) [Csaba Hoch]

- Update CA\_CERTS\_PATH to also look for CA cert bundle which comes with openssl Homebrew formula on OS x (/usr/local/etc/openssl/cert.pem). (GITHUB-309) [Pedro Romano]
- Update Google drivers to allow simultaneous authornization for all the supported Google Services. (GITHUB-302) [Eric Johnson]

# Compute

- Fix create\_key\_pair method which was not returning private key. (LIBCLOUD-566) [Sebastien Goasguen]
- Map "Stopped" node state in the CloudStack driver to NodeState.STOPPED instead of NodeState.TERMINATED, "Stopping" to NodeState.PENDING instead of NodeState.TERMINATED and "Expunging" to NodeState.PENDING instead of NodeState.TERMINATED. (GITHUB-246) [Chris DeRamus, Tomaz Muraus]
- Add ex\_create\_tags and ex\_delete\_tags method to the CloudStack driver. (LIBCLOUD-514, GITHUB-248) [Chris DeRamus]
- Add new G2 instances to the EC2 driver. [Tomaz Muraus]
- Add support for multiple API versions to the Eucalyptus driver and allows user to pass "api\_version" argument to the driver constructor. (LIBCLOUD-516, GITHUB-249) [Chris DeRamus]
- Map "Powered Off" state in the vCloud driver from "TERMINATED" to "STOPPED". (GITHUB-251) [Ash Berlin]
- Add ex\_rename\_node method to the DigitalOcean driver. (GITHUB-252) [Rahul Ranjan]
- Improve error parsing in the DigitalOcean driver.
  - Reported by Deni Bertovic. [Tomaz Muraus]
- Add extension methods for the VPC internet gateway management to the EC2 driver. (LIBCLOUD-525, GITHUB-255) [Chris DeRamus]
- Add CloudStackProject class to the CloudStack driver and add option to select project and disk offering on node creation. (LIBCLOUD-526, GITHUB-257) [Jim Divine]
- Fix IP address handling in the OpenStack driver. (LIBCLOUD-503, GITHUB-235) [Markos Gogoulos]
- Ad new ex\_delete\_image and ex\_deprecate\_image method to the GCE driver. (GITHUB-260) [Franck Cuny]
- Ad new ex\_copy\_image method to the GCE driver. (GITHUB-258) [Franck Cuny]
- Ad new ex\_set\_volume\_auto\_delete method to the GCE driver. (GITHUB-264) [Franck Cuny]
- Add ex\_revoke\_security\_group\_ingress method to the CloudStack driver. [Chris DeRamus, Tomaz Muraus]
- Allow user to pass ex\_ebs\_optimized argument to the create\_node method in the EC2 driver. (GITHUB-272) [zerthimon]
- Add "deprecated" attribute to the Node object in the Google Compute Engine driver. (GITHUB-276) [Chris / bassdread]
- Update Softlayer driver to use "fullyQualifiedDomainName" instead of "hostname" attribute for the node name. (GITHUB-280) [RoelVanNyen]
- Allow user to specify target tags using target\_tags attribute when creating a firewall rule in the GCE driver. (GITHUB-278) [zerthimon]
- Add new standard API for image management and initial implementation for the EC2 and Rackspace driver. (GITHUB-277) [Matt Lehman]

- Allow user to specify "displayname" attribute when creating a CloudStack node by passing "ex\_displayname" argument to the method.
  - Also allow "name" argument to be empty (None). This way CloudStack automatically uses Node's UUID for the name. (GITHUB-289) [Jeff Moody]
- Deprecate "key" argument in the SSHClient class in favor of new "key\_files" argument.
  - Also add a new "key\_material" argument. This argument can contain raw string version of a private key.
  - Note 1: "key\_files" and "key\_material" arguments are mutually exclusive. Note 2: "key\_material" argument is not supported in the ShellOutSSHClient.
- Use node id attribute instead of the name for the "lconfig" label in the Linode driver. This way the label is never longer than 48 characters. (GITHUB-287) [earthgecko]
- Add a new driver for Outscale SAS and Outscale INC cloud (http://www.outscale.com). (GITHUB-285, GITHUB-293, LIBCLOUD-536, LIBCLOUD-553) [Benoit Canet]
- Add new driver for HP Public Cloud (Helion) available via Provider.HPCLOUD constant. [Tomaz Muraus]
- Allow user to specify availability zone when creating an OpenStack node by passing "ex\_availability\_zone" argument to the create\_node method. Note: This will only work if the OpenStack installation is running availability zones extension. (GITHUB-295, LIBCLOUD-555) [syndicut]
- Allow user to pass filters to ex\_list\_networks method in the EC2 driver. (GITHUB-294) [zerthimon]
- Allow user to retrieve container images using ex\_get\_image method in the Google Compute Engine driver. (GITHUB-299, LIBCLOUD-562) [Magnus Andersson]
- Add new driver for Kili public cloud (http://kili.io/) [Tomaz Muraus]
- Add "timeout" argument to the ParamikoSSHClient.run method. If this argument is specified and the command passed to run method doesn't finish in the defined timeout, SSHCommandTimeoutError is throw and the connection to the remote server is closed.
  - Note #1: If timed out happens, this functionality doesn't guarantee that the underlying command will be stopped / killed. The way it works it simply closes a connect to the remote server. [Tomaz Muraus]
  - Note #2: "timeout" argument is only available in the Paramiko SSH client.
- Make "cidrs\_ips" argument in the ex\_authorize\_security\_group\_egress method in the EC2 driver mandatory. (GITHUB-301) [Csaba Hoch]
- Add extension methods for managing floating IPs (ex\_get\_floating\_ip, ex\_create\_floating\_ip, ex\_delete\_floating\_ip) to the Openstack 1.1 driver. (GITHUB-301) [Csaba Hoch]
- Fix bug in RimuHosting driver which caused driver not to work when the provider returned compressed (gzip'ed) response. (LIBCLOUD-569, GITHUB-303) [amastracci]
- Fix issue with overwriting the server memory values in the RimuHosting driver. (GUTHUB-308) [Dustin Oberloh]
- Add ex\_all\_tenants argument to the list\_nodes method in the OpenStack driver. (GITHUB-312) [LIBCLOUD-575, Zak Estrada]
- Add support for network management for advanced zones (ex\_list\_network\_offerings, ex\_create\_network, ex\_delete\_network) in the CloudStack driver. (GITHUB-316) [Roeland Kuipers]
- Add extension methods for routes and route table management to the EC2 driver (ex\_list\_route\_tables, ex\_create\_route\_table, ex\_delete\_route\_table, ex\_associate\_route\_table, ex\_dissociate\_route\_table, ex\_replace\_route\_table\_association, ex\_create\_route, ex\_delete\_route, ex\_replace\_route) (LIBCLOUD-574, GITHUB-313) [Lior Goikhburg]
- Fix ex list snapshots for HP Helion OpenStack based driver. [Tomaz Muraus]

- Allow user to specify volume type and number of IOPS when creating a new volume in the EC2 driver by passing ex\_volume\_type and ex\_iops argument to the create\_volume method. [Tomaz Muraus]
- Fix ex\_unpause\_node method in the OpenStack driver. (GITHUB-317) [Pablo Orduña]
- Allow user to launch EC2 node in a specific VPC subnet by passing ex\_subnet argument to the create\_node method. (GITHUB-318) [Lior Goikhburg]

• Fix container name encoding in the iterate\_container\_objects and get\_container\_cdn\_url method in the Cloud-Files driver. Previously, those methods would throw an exception if user passed in a container name which contained a whitespace.

Reported by Brian Metzler. (LIBCLOUD-552) [Tomaz MUraus]

• Fix a bug in the OpenStack Swift driver which prevented the driver to work with installations where region names in the service catalog weren't upper case. (LIBCLOUD-576, GITHUB-311) [Zak Estrada]

### **Load Balancer**

• Add extension methods for policy managagement to the ELB driver. (LIBCLOUD-522, GITHUB-253) [Rahul Ranjan]

### **DNS**

- Fix update\_record method in the Route56 driver so it works correctly for records with multiple values. [Tomaz Muraus]
- Add ex\_create\_multi\_value\_record method to the Route53 driver which allows user to create a record with multiple values with a single call. [Tomaz Muraus]
- Add new driver for Google DNS. (GITHUB-269) [Franck Cuny]

#### Changes with Apache Libcloud 0.14.1

### Compute

- Add new m3.medium and m3.large instance information to the EC2 driver. [Tomaz Muraus]
- Add a new driver for CloudSigma API v2.0. [Tomaz Muraus]
- Add "volume\_id" attribute to the Node "extra" dictionary in the EC2 driver. Also fix the value of the "device" extra attribute in the StorageVolume object. (LIBCLOUD-501) [Oleg Suharev]
- Add the following extension methods to the OpenStack driver: ex\_pause\_node, ex\_unpause\_node, ex suspend node, ex resume node. (LIBCLOUD-505, GITHUB-238) [Chris DeRamus]
- Add ex limits method to the CloudStack driver. (LIBCLOUD-507, GITHUB-240) [Chris DeRamus]
- Add "extra" dictionary to the CloudStackNode object and include more attributes in the "extra" dictionary of the network and volume object. (LIBCLOUD-506, GITHUB-239) [Chris DeRamus]
- Add ex\_register\_image method to the EC2 driver. (LIBCLOUD-508, GITHUB-241) [Chris DeRamus]

Add methods for managing volume snapshots to the OpenStack driver. (LIBCLOUD-512, GITHUB-245) [Chris DeRamus]

#### **Load Balancer**

• Fix a bug in the ex\_targetpool\_add\_node and ex\_targetpool\_remove\_node method in the GCE driver. [Rick Wright]

## **Storage**

• Allow user to use an internal endpoint in the CloudFiles driver by passing "use\_internal\_url" argument to the driver constructor. (GITHUB-229, GITHUB-231) [John Obelenus]

### **DNS**

- Add PTR to the supported record types in the Rackspace driver. [Tomaz Muraus]
- Fix Zerigo driver to set Record.name attribute for records which refer to the bare domain to "None" instead of an empty string. [Tomaz Muraus]
- For consistency with other drivers, update Rackspace driver to set Record.name attribute for the records which refer to the bare domain to "None" instead of setting them to FQDN. [Tomaz Muraus]
- Update Rackspace driver to support paginating through zones and records. (GITHUB-230) [Roy Wellington]
- Update Route53 driver so it supports handling records with multiple values (e.g. MX). (LIBCLOUD-504, GITHUB-237) [Chris DeRamus]
- Update Route53 driver to better handle SRV records. [Tomaz Muraus]
- Update Route53 driver, make sure "ttl" attribute in the Record extra dictionary is always an int. [Tomaz Muraus]

## Changes with Apache Libcloud 0.14.0

#### General

- Update API endpoints which are used in the HostVirtual drivers. (LIBCLOUD-489) [Dinesh Bhoopathy]
- Add support for Amazon security token to the Amazon drivers. (LIBCLOUD-498, GITHUB-223) [Noah Kantrowitz]

### Compute

- · Remove Slicehost driver.
  - SliceHost API has been shut down in 2012 so it makes no sense to keep this driver. [Tomaz Muraus]
- Modify drivers for public cloud providers which use HTTP Basic authentication to not allow insecure connections (secure constructor kwarg being set to False) by default.

This way credentials can't accidentally be sent in plain text over the write.

Affected drivers: Bluebox, Joyent, NephoScale, OpSource, VPSNet [Tomaz Muraus]

- Remove "public\_ip" and "private\_ip" property which has been deprecated in 0.7.0 from the Node object. [Tomaz Muraus]
- Move "is\_private\_ip" and "is\_valid\_ip\_address" function from libcloud.compute.base into lib-cloud.utils.networking module. [Tomaz Muraus]
- Allow user to pass "url" argument to the CloudStack driver constructor. This argument can be provided instead
  of "host" and "path" arguments and can contain a full URL to the API endpoint. (LIBCLOUD-430) [Tomaz
  Muraus]
- Allow user to pass None as a "location" argument to the create\_node method. (LIBCLOUD-431) [Tomaz Muraus]
- Refactor CloudStack Connection class so it looks more like other connection classes and user can specify which attributes to send as part of query parameters in the GET request and which inside the body of a POST request. [Tomaz Muraus, Philipp Strube]
- Add a new driver for Exoscale (https://www.exoscale.ch/) provider. [Tomaz Muraus]
- Fix a bug in Abiquo driver which caused the driver to fail if the endpoint URL didn't start with "/api". (LIBCLOUD-447)
  - Reported by Igor Ajdisek. [Tomaz Muraus]
- Modify CloudStack driver to correctly throw InvalidCredsError exception if invalid credentials are provided. [Tomaz Muraus]
- Don't throw an exception if a node object is missing an "image" attribute in the list nodes / get node response.

  This could happen if node is in an error state. (LIBCLOUD-455) [Dustin Spicuzza, Tomaz Muraus]
- Update CloudStack driver to better handle errors and throw ProviderError instead of a generic Exception. [Tomaz Muraus]
- Modify ex\_list\_networks methods in CloudStack driver to not thrown if there are no networks available. [Tomaz Muraus]
- Bump API version used in the EC2 driver from 2010-08-21 to 2013-10-15. (LIBCLOUD-454) [Tomaz Muraus]
- Add ex\_get\_limits method for retrieving account resource limits to the EC2 driver. [Tomaz Muraus]
- Update us-west-1 region in the EC2 driver to include c3 instance types. Also include pricing information. [Tomaz Muraus]
- For consistency, rename "ex\_add\_ip\_forwarding\_rule" method to "ex\_create\_ip\_forwarding\_rule". (GITHUB-196) [Oleg Suharev]
- Add support for new "i2" instance types to Amazon EC2 driver. Also update pricing file. (LIBCLOUD-465) [Chris DeRamus]
- Allow user to specify VPC id when creating a security group in the EC2 driver by passing "vpc\_id" argument to ex\_create\_security\_group method. (LIBCLOUD-463, GITHUB-201) [Chris DeRamus]
- Add extension methods for managing security group rules (ex\_authorize\_security\_group\_ingress, ex\_authorize\_security\_group\_egress, ex\_revoke\_security\_group\_ingress, ex\_revoke\_security\_group\_egress) to the EC2 driver. (LIBCLOUD-466, GITHUB-202) [Chris DeRamus]
- Add extension methods for deleting security groups (ex\_delete\_security\_group, ex\_delete\_security\_group\_by\_id, ex\_delete\_security\_group\_by\_name) to the EC2 driver. (LIBCLOUD-464, GITHUB-199) [Chris DeRamus]
- Add extension method for listing reserved instances (ex\_list\_reserved\_nodes) to the EC2 driver. (LIBCLOUD-469, GITHUB-205) [Chris DeRamus]

- Add extension methods for VPC management (ex\_list\_networks, ex\_create\_network, ex\_delete\_network) to the EC2 driver. (LIBCLOUD-467, GITHUB-203) [Chris DeRamus]
- Add extension methods for VPC subnet management (ex\_list\_subnets, ex\_create\_subnet, ex\_delete\_subnet) to the EC2 driver. (LIBCLOUD-468, GITHUB-207) [Chris DeRamus]
- Add ex\_get\_console\_output extension method to the EC2 driver. (LIBCLOUD-471, GITHUB-209) [Chris De-Ramus]
- Include additional provider-specific attributes in the 'extra' dictionary of the StorageVolume class in the EC2 driver. (LIBCLOUD-473, GITHUB-210) [Chris DeRamus]
- Change attribute name in the 'extra' dictionary of EC2 and CloudStack Node object from "keyname" to "key\_name". (LIBCLOUD-475) [Oleg Suharev]
- Fix a deployment issue which would some times cause a process to hang if the executed deployment script printed a lot of output to stdout or stderr. [Tomaz Muraus]
- · Add additional attributes to the "extra" dictionary of the VolumeSnapshot object in the EC2 driver.
  - Also modify create\_volume\_snapshot method to correctly handle "name" argument. Previous, "name" argument was used as a snapshot description, now it's used as a Tag with a key "Name". (LIBCLOUD-480, GITHUB-214) [Chris DeRamus]
- Store additional attributes (iops, tags, block\_device\_mapping) in the "extra" dictionary of the NodeImage object in the EC2 driver.
  - Also fix ex\_image\_ids filtering in the list\_images method. (LIBCLOUD-481, GITHUB-215) [Chris DeRamus]
- Add extension methods for network interface management (ex\_list\_network\_interfaces, ex\_create\_network\_interface, ex\_attach\_network\_interface\_to\_node, ex\_detach\_network\_interface, ex\_delete\_network\_interface) to the EC2 driver. (LIBCLOUD-474) [Chris DeRamus]
- Update Google Compute Engine driver to use and work with API v1. (LIBCLOUD-450) [Rick Wright]
- Modify ParamikoSSHClient so that "password" and "key" arguments are not mutually exclusive and both can be provided. (LIBCLOUD-461, GITHUB-194) [Markos Gogoulos]
- Add extension methods for the Elastic IP management to the EC2 driver. Also modify "ex\_allocate\_address" and "ex\_release\_address" method to take "domain" argument so it also works with VPC. (LIBCLOUD-470, GITHUB-208, GITHUB-220) [Chris DeRamus]
- Add additional provider specific attributes to the "extra" dictionary of the Node object in the EC2 driver. (LIBCLOUD-493, GITHUB-221) [Chris DeRamus]
- Add ex\_copy\_image and ex\_create\_image\_from\_node method to the EC2 driver. (LIBCLOUD-494, GITHUB-222) [Chris DeRamus]

- Allow user to specify 'Content-Disposition' header in the CloudFiles driver by passing 'content\_disposition' key in the extra dictionary of the upload object methods. (LIBCLOUD-430) [Michael Farrell]
- Fix CloudFiles driver so it references a correct service catalog entry for the CDN endpoint.
  - This was broken in the 0.14.0-beta3 release when we migrated all the Rackspace drivers to use auth 2.0 by default. (GITHUB-186) [John Obelenus]
- Update storage drivers to default to "application/octet-stream" Content-Type if none is provided and none can be guessed. (LIBCLOUD-433) [Michael Farrell]

- Fix a bug so you can now upload 0 bytes sized objects using multipart upload in the S3 driver. (LIBCLOUD-490) Reported by Noah Kantrowitz. [Tomaz Muraus]
- Update OpenStack Swift driver constructor so it accepts "region", "ex\_force\_service\_type" and "ex\_force\_service\_name" argument. [Tomaz Muraus]
- Deprecate "CLOUDFILES\_SWIFT" provider constant in favor of new "OPENSTACK\_SWIFT" one. [Tomaz Muraus]
- Add support for setting an ACL when uploading and object. (LIBCLOUD-497, GITHUB-223) [Noah Kantrowitz]
- Modify get\_container method to use a more efficient "HEAD" approach instead of calling list\_containers + doing late filterting. (LIBCLOUD-498, GITHUB-223) [Noah Kantrowitz]

### **DNS**

- Implement iterate\_\* methods in the Route53 driver and makes it work correctly if there are more results which can fit on a single page. Previously, only first 100 results were returned. (LIBCLOUD-434) [Chris Clarke]
- Update HostVirtual driver constructor to only take "key" and other valid arguments. Previously it also took "secret" argument which it silently ignored. (LIBCLOUD-483)
  - Reported by Andrew Udvare. [Tomaz Muraus]
- Fix list\_records method in the HostVirtual driver. (LIBCLOUD-484, GITHUB-218)
  - Reported by Andrew Udvare. [Dinesh Bhoopathy]

#### Changes with Apache Libcloud 0.14.0-beta3

#### General

- If the file exists, read pricing data from ~/.libcloud/pricing.json by default. If the file doesn't exist, fall back to the old behavior and use pricing data which is bundled with the release. [Tomaz Muraus]
- Add libcloud.pricing.download\_pricing\_file function for downloading and updating the pricing file. [Tomaz Muraus]
- Fix libcloud.utils.py3.urlquote so it works with unicode strings under Python 2. (LIBCLOUD-429) [Michael Farrell]

### Compute

- Refactor Rackspace driver classes and make them easier to use. Now there are two Rackspace provider constants - Provider.RACKSPACE which represents new next-gen OpenStack servers and Provider.RACKSPACE\_FIRST\_GEN which represents old first-gen cloud servers.
  - Note: This change is backward incompatible. For more information on those changes and how to update your code, please visit "Upgrade Notes" documentation page http://s.apache.org/lc0140un [Tomaz Muraus]
- Deprecate the following EC2 provider constants: EC2\_US\_EAST, EC2\_EU, EC2\_EU\_WEST, EC2\_AP\_SOUTHEAST, EC2\_AP\_NORTHEAST, EC2\_US\_WEST\_OREGON, EC2\_SA\_EAST, EC2\_SA\_EAST and replace it with a new EC2 constant. Driver referenced by this new constant now takes a "region" argument which dictates to which region to connect.

Note: Deprecated constants will continue to work until the next major release. For more information on those changes and how to update your code, please visit "Upgrade Notes" documentation page - http://s.apache.org/lc0140un [Tomaz Muraus]

- Add support for volume related functions to OpenNebula driver. (LIBCLOUD-354) [Emanuele Rocca]
- Add methods for managing storage volumes to the OpenStack driver. (LIBCLOUD-353) [Bernard Kerckenaere]
- Add new driver for Google Compute Engine (LIBCLOUD-266, LIBCLOUD-386) [Rick Wright]
- Fix create node "features" metadata and update affected drivers. (LIBCLOUD-367) [John Carr]
- Update EC2 driver to accept the auth kwarg (it will accept NodeAuthSSH objects and automatically import a public key that is not already uploaded to the EC2 keyring). (Follow on from LIBCLOUD-367). [John Carr]
- Unify extension argument names for assigning a node to security groups in EC2 and OpenStack driver. Argument in the EC2 driver has been renamed from ex\_securitygroup to ex\_security\_groups. For backward compatibility reasons, old argument will continue to work until the next major release. (LIBCLOUD-375) [Tomaz Muraus]
- Add ex\_import\_keypair\_from\_string and ex\_import\_keypair method to the CloudStack driver. (LIBCLOUD-380) [Sebastien Goasguen]
- Add support for managing floating IP addresses to the OpenStack driver. (LIBCLOUD-382) [Ivan Kusalic]
- Add extension methods for handling port forwarding to the CloudStack driver, rename CloudStackForwardingRule class to CloudStackIPForwardingRule. (LIBCLOUD-348, LIBCLOUD-381) [sebastien goasguen]
- Hook up deploy\_node functionality in the CloudStack driver and unify extension arguments for handling security groups. (LIBCLOUD-388) [sebastien goasguen]
- Allow user to pass "args" argument to the ScriptDeployment and ScriptFileDeployment class. This argument tells which command line arguments get passed to the ScriptDeployment script. (LIBCLOUD-394)
  - Note: This change is backward incompatible. For more information on how this affects your code and how to update it, visit "Upgrade Notes" documentation page http://s.apache.org/lc0140un [Tomaz Muraus]
- Allow user to specify IAM profile to use when creating an EC2 node. (LIBCLOUD-403) [Xavier Barbosa]
- Add support for keypair management to the OpenStack driver. (LIBCLOUD-392) [L. Schaub]
- Allow user to specify disk partitioning mode using ex\_disk\_config argument in the OpenStack based drivers. (LIBCLOUD-402) [Brian Curtin]
- Add new driver for NephoScale provider (http://nephoscale.com/). (LIBCLOUD-404) [Markos Gogoulos]
- Update network related extension methods so they work correctly with both, OpenStack and Rackspace driver. (LIBCLOUD-368) [Tomaz Muraus]
- Add tests for networking functionality in the OpenStack and Rackspace driver. [Tomaz Muraus]
- Allow user to pass all supported extension arguments to ex\_rebuild\_server method in the OpenStack driver.
   (LIBCLOUD-408) [Dave King]
- Add pricing information for Rackspace Cloud Sydney region. [Tomaz Muraus]
- Update EC2 instance type map and pricing data. High Storage instances are now also available in Sydney and Singapore region. [Tomaz Muraus]
- Add new methods for managing storage volumes and snapshots to the EC2 driver (list\_volumes, list\_snapshots, destroy\_volume\_snapshot, create\_volume\_snapshot) (LIBCLOUD-409) [Oleg Suharev]
- Add the following new extension methods to EC2 driver: ex\_destroy\_image, ex\_modify\_instance\_attributes, ex\_delete keypair. (LIBCLOUD-409) [Oleg Suharev]
- Allow user to specify a port range when creating a port forwarding rule. (LIBCLOUD-409) [Oleg Suharev]

• Align Joyent driver with other drivers and deprecate "location" argument in the driver constructor in favor of "region" argument.

Note: Deprecated argument will continue to work until the next major release. [Tomaz Muraus]

 Deprecate the following ElasticHosts provider constants: ELASTICHOSTS\_UK1, ELASTICHOSTS\_UK2, ELASTICHOSTS\_US1, ELASTICHOSTS\_US2, ELASTICHOSTS\_US3, ELASTICHOSTS\_CA1, ELASTICHOSTS\_CA1, ELASTICHOSTS\_AU1, ELASTICHOSTS\_CN1 and replace it with a new ELASTICHOSTS constant. Driver referenced by this new constant now takes a "region" argument which dictates to which region to connect.

Note: Deprecated constants will continue to work until the next major release. For more information on those changes and how to update your code, please visit "Upgrade Notes" documentation page - http://s.apache.org/lc0140un (LIBCLOUD-383) [Michael Bennett, Tomaz Muraus]

- Add log statements to our ParamikoSSHClient wrapper. This should make debugging deployment issues easier. (LIBCLOUD-414) [Tomaz Muraus]
- Add new "NodeState.STOPPED" node state. Update HostVirual and EC2 driver to also recognize this new state. (LIBCLOUD-296) [Jayy Vis]
- Add new Hong Kong endpoint to Rackspace driver. [Brian Curtin]
- Fix ex\_delete\_keypair method in the EC2 driver. (LIBCLOUD-415) [Oleg Suharev]
- Add the following new extension methods for elastic IP management to the EC2 driver: ex\_allocate\_address, ex\_disassociate\_address, ex\_release\_address. (LIBCLOUD-417) [Patrick Armstrong]
- For consistency and accuracy, rename "ex\_associate\_addresses" method in the EC2 driver to "ex associate address with node".

Note: Old method will continue to work until the next major release. [Tomaz Muraus]

- Add new driver for CloudFrames (http://www.cloudfounders.com/CloudFrames) provider. (LIBCLOUD-358) [Bernard Kerckenaere]
- Update default kernel versions which are used when creating a Linode server.

Old default kernel versions:

- x86 2.6.18.8-x86\_64-linode1
- x86\_64 2.6.39.1-linode34

New default kernel versions:

- x86 3.9.3-x86-linode52
- x86 64 3.9.3-x86 64-linode33

(LIBCLOUD-424) [Tomaz Muraus, Jon Chen]

- Disable cache busting functionality in the OpenStack and Rackspace next-gen driver and enable it only for Rackspace first-gen driver. [Tomaz Muraus]
- Update Google Compute Engine driver to v1beta16. [Rick Wright]
- Modify auth\_url variable in the OpenStack drivers so it works more like users would expect it to.

Previously path specified in the auth\_url was ignored and only protocol, hostname and port were used. Now user can provide a full url for the auth\_url variable and the path provided in the url is also used. [DaeMyung Kang, Tomaz Muraus]

• Allow user to associate arbitrary key/value pairs with a node by passing "ex\_metadata" argument (dictionary) to create\_node method in the EC2 driver. Those values are associated with a node using tags functionality. (LIBCLOUD-395) [Ivan Kusalic]

- Add "ex\_get\_metadata" method to EC2 and OpenStack driver. This method reads metadata dictionary from the Node object. (LIBCLOUD-395) [Ivan Kusalic]
- Multiple improvements in the Softlayer driver:
  - Map "INITIATING" node state to NodeState.PENDING
  - If node is launching remap "halted" state to "pending"
  - Add more node sizes
  - Add ex\_stop\_node and ex\_start\_node method
  - Update tests response fixtures

(LIBCLOUD-416) [Markos Gogoulos]

- Modify list\_sizes method in the KT UCloud driver to work, even if the item doesn't have 'diskofferingid' attribute. (LIBCLOUD-435) [DaeMyung Kang]
- Add new c3 instance types to the EC2 driver. [Tomaz Muraus]
- Fix an issue with the ex\_list\_keypairs and ex\_list\_security\_groups method in the CloudStack driver which caused an exception to be thrown if the API returned no keypairs / security groups. (LIBCLOUD-438) [Carlos Reategui, Tomaz Muraus]
- Fix a bug in the OpenStack based drivers with not correctly checking if the auth token has expired before re-using it. (LIBCLOUD-428)

Reported by Michael Farrell. [Tomaz Muraus, Michael Farrell]

# **Storage**

- Deprecate CLOUDFILES\_US and CLOUDFILES\_UK provider constant and replace it with a new CLOUD-FILES constant. Driver referenced by this new constant takes a "region" keyword argument which can be one of 'ord', 'dfw', 'iad', 'syd', 'lon'.
  - Note: Deprecated constants will continue to work until the next major release. For more information on this change, please visit "Upgrade Notes" documentation section http://s.apache.org/lc0140un [Tomaz Muraus]
- Allow users to filter objects starting with a prefix by passing ex\_prefix argument to the list\_container\_objects method in the S3, Google Storage and CloudFiles driver. (LIBCLOUD-369) [Stefan Friesel]
- Fix an issue with mutating connectionCls.host attribute in the Azure driver. This bug prevented user from having multiple Azure drivers with different keys instantiated at the same time. (LIBCLOUD-399) [Olivier Grisel]
- Add a new driver for KT UCloud based on the OpenStack Swift driver. (LIBCLOUD-431). [DaeMyung Kang]

#### **Load Balancer**

- Deprecate RACKSPACE\_US and RACKSPACE\_UK provider constant and replace it with a new RACKSPACE
  constant. Driver referenced by this new constant takes a "region" keyword argument which can be one of the
  following: 'ord', 'dfw', 'iad', 'syd', 'lon'.
  - Note: Deprecated constants will continue to work until the next major release. For more information on this change, please visit "Upgrade Notes" documentation section http://s.apache.org/lc0140un [Tomaz Muraus]
- Add new driver for Google Compute Engine (LIBCLOUD-386) [Rick Wright]
- Add new Hong Kong endpoint to Rackspace driver. [Brian Curtin]

### **DNS**

Deprecate RACKSPACE\_US and RACKSPACE\_UK provider constant and replace it with a new RACKSPACE
constant. Driver referenced by this new constant takes a "region" keyword argument which can be one of the
following: 'us', 'uk'.

Note: Deprecated constants will continue to work until the next major release. For more information on this change, please visit "Upgrade Notes" documentation section - http://s.apache.org/lc0140un [Tomaz Muraus]

• Use string instead of integer for RecordType ENUM value.

Note: If you directly use an integer instead of RecordType ENUM class you need to update your code to use the RecordType ENUM otherwise the code won't work. For more information on how to do that, see "Upgrade Notes" documentation section - http://s.apache.org/lc0140un [Tomaz Muraus]

- Add "export\_zone\_to\_bind\_format" and export\_zone\_to\_bind\_zone\_file method which allows users to export Libcloud Zone to BIND zone format. (LIBCLOUD-398) [Tomaz Muraus]
- Update issue with inexistent zone / record handling in the get\_zone and get\_record method in the Linode driver. Those issues were related to changes in the Linode API. (LIBCLOUD-425) [Jon Chen]

### Changes with Apache Libcloud 0.13.3

### Compute

• Send "scrub\_data" query parameter when destroying a DigitalOcean node. This will cause disk to be scrubbed (overwritten with 0's) when destroying a node. (LIBCLOUD-487)

Note: This fixes a security issue with a potential leak of data contained on the destroyed node which only affects users of the DigitalOcean driver. (CVE-2013-6480) [Tomaz Muraus]

# Changes with Apache Libcloud 0.13.2

#### General

• Don't sent Content-Length: 0 header with POST and PUT request if "raw" mode is used. This fixes a regression which could cause broken behavior in some storage driver when uploading a file from disk. (LIBCLOUD-396) [Ivan Kusalic]

### Compute

- Added Ubuntu Linux 12.04 image to ElasticHost driver image list. (LIBCLOUD-364) [Bob Thompson]
- Update ElasticHosts driver to store drive UUID in the node 'extra' field. (LIBCLOUD-357) [Bob Thompson]

#### Storage

• Store last modified timestamp in the Object extra dictionary in the S3 driver. (LIBCLOUD-373) [Stefan Friesel]

### **Load Balancer**

• Expose CloudStack driver directly through the Provider.CLOUDSTACK constant. [Tomaz Muraus]

### **DNS**

- Modify Zerigo driver to include record TTL in the record 'extra' attribute if a record has a TTL set. [Tomaz Muraus]
- Modify values in the Record 'extra' dictionary attribute in the Zerigo DNS driver to be set to None instead of an empty string ('') if a value for the provided key is not set. [Tomaz Muraus]

# Changes with Apache Libcloud 0.13.1

#### General

• Fix a regression introduced in 0.13.0 and make sure to include Content-Length 0 with PUT and POST requests. (LIBCLOUD-362, LIBCLOUD-390) [Tomaz Muraus]

# **Compute**

- Fix a bug in the ElasticHosts driver and check for right HTTP status code when determining drive imaging success. (LIBCLOUD-363) [Bob Thompson]
- Update Opsource driver to include node public ip address (if available). (LIBCLOUD-384) [Michael Bennett]

## **Storage**

- Fix a regression with calling encode\_container\_name instead of encode\_object\_name on object name in get\_object method. Reported by Ben Meng (LIBCLOUD-366) [Tomaz Muraus]
- Ensure that AWS S3 multipart upload works for small iterators. (LIBCLOUD-378) [Mahendra M]

## Changes with Apache Libcloud 0.13.0

#### General

- Add homebrew curl-ca-bundle path to CA\_CERTS\_PATH. This will make Libcloud use homebrew curl ca bundle file (if available) for server certificate validation. (LIBCLOUD-324) [Robert Chiniquy]
- Modify OpenStackAuthConnection and change auth\_token\_expires attribute to be a datetime object instead of a string. [Tomaz Muraus]
- Modify OpenStackAuthConnection to support re-using of the existing auth token if it's still valid instead of re-authenticating on every authenticate() call. [Tomaz Muraus]
- Modify base Connection class to not send Content-Length header if body is not provided. [Tomaz Muraus]
- Add the new error class ProviderError and modify InvalidCredsError to inherit from it. (LIBCLOUD-331) [Jayy Vis]

# Misc

• Add unittest2 library dependency for tests and update some tests to use it. [Tomaz Muraus]

# Compute

- Fix destroy\_node method in the experimental libvirt driver. [Aymen Fitati]
- Add ex\_start\_node method to the Joyent driver. (LIBCLOUD-319) [rszabo50]
- Fix Python 3 compatibility issue in the ScriptFileDeployment class. (LIBCLOUD-321) [Arfrever Frehtes Taifersar Arahesis]
- Add ex\_set\_metadata\_entry and ex\_get\_metadata method to the VCloud driver. (LIBCLOUD-318) [Michel Samia]
- Various improvements and bug-fixes in the VCloud driver. (LIBCLOUD-323) [Michel Samia]
- Various bug fixes and improvements in the HostVirtual driver. (LIBCLOUD-249) [Dinesh Bhoopathy]
- Modify list\_sizes method in the OpenStack driver to include OpenStackNodeSize object which includes 'vcpus' attribute which holds a number of virtual CPUs for this size. (LIBCLOUD-325) [Carlo]
- For consistency rename "ex\_describe\_keypairs" method in the EC2 driver to "ex\_describe\_keypair". [Tomaz Muraus]
- Modify "ex\_describe\_keypair" method to return key fingerprint in the return value. (LIBCLOUD-326) [Andre Merzky, Tomaz Muraus]
- Populate private\_ips attribute in the CloudStack drive when returning a Node object from the create\_node method. (LIBCLOUD-329) [Sebastien Goasguen, Tomaz Muraus]
- Allow user to pass extra arguments via "extra\_args" argument which are then passed to the "deployVirtual-Machine" call in the CloudStack driver create\_node method. (LIBCLOUD-330) [Sebastien Goasguen, Tomaz Muraus]
- Update Gandi driver to handle new billing model. (LIBCLOUD-317) [Aymeric Barantal]
- Fix a bug in the Linode driver and remove extra newline which is added when generating a random root password in create\_node. (LIBCLOUD-334) [Juan Carlos Moreno]
- Add extension methods for managing keypairs to the CloudStack driver. (LIBCLOUD-333) [sebastien goas-guen]
- Add extension methods for managing security groups to the CloudStack driver. (LIBCLOUD-332) [sebastien goasguen]
- Add extension methods for starting and stoping the node to the CloudStack driver. (LIBCLOUD-338) [sebastien goasguen]
- Fix old \_wait\_until\_running method. (LIBCLOUD-339) [Bob Thompson]
- Allow user to override default async task completion timeout by specifying ex\_clone\_timeout argument. (LIBCLOUD-340) [Michal Galet]
- Fix a bug in the GoGrid driver get uuid method. (LIBCLOUD-341) [Bob Thompson]
- Fix a bug with deploy\_node not respecting 'timeout' kwarg. [Kevin Carter]
- Modify create\_node method in CloudStack driver to return an instance of CloudStackNode and add a new "expunging" node state. (LIBCLOUD-345) [sebastien goasguen]
- Update API endpoint hostnames in the ElasticHost driver and use hostnames which return a valid SSL certificate. (LIBCLOUD-346) [Bob Thompson]
- Add ex\_list\_networks method and missing tests for list\_templates to the CloudStack driver. (LIBCLOUD-349) [Philipp Strube]
- Correctly throw InvalidCredsError if user passes invalid credentials to the DigitalOcean driver. [Tomaz Muraus]

• Fix an issue with double encoding the container name in the CloudFiles driver upload\_object method. Also properly encode container and object name used in the HTTP request in the get\_container and get\_object method. (LIBCLOUD-328) [Tomaz Muraus]

#### **Load Balancer**

• Add ex\_list\_current\_usage method to the Rackspace driver.

# Changes with Apache Libcloud 0.12.4

## Compute

- Fix a regression in Softlayer driver caused by the xmlrpclib changes. (LIBCLOUD-310) [Jason Johnson]
- Allow user to pass alternate ssh usernames to deploy\_node (ssh\_alternate\_usernames kwarg) which are used for authentication if the default one doesn't work. (LIBCLOUD-309) [Chris Psaltis, Tomaz Muraus]
- Fix a bug in EC2 list\_locations method 'name' attribute didn't contain a the right value. [Tomaz Muraus]
- Add new ScriptFileDeployment deployment class which reads deploy script from a file. [Rudolf J Streif]
- Add support for API version 5.1 to the vCloud driver and accept any value which is a multiple of four for ex\_vm\_memory kwarg in create\_node method. (LIBCLOUD-314) [Trevor Powell]

## **Storage**

• Fix a regression with removed ex\_force\_service\_region constructor kwarg in the CloudFiles driver. (LIBCLOUD-260)

## Changes with Apache Libcloud 0.12.3

#### General

- Fix Python 3.x related regressions. (LIBCLOUD-245) Reported by Arfrever Frehtes Taifersar Arahesis. [Tomaz Muraus]
- Fix a regression introduced with recent xmlrpiclib changes which broke all the Gandi.net drivers. (LIBCLOUD-288)

Reported by Hutson Betts. [Tomaz Muraus]

• Improve deploy code to work correctly if the ssh user doesn't have access to the /root directory.

Previously the ScriptDeployment script was stored in /root folder by default. Now it's stored in users home directory under filename ~/libcloud\_deploymeny\_<random>.sh. (LIBCLOUD-302)

Reported by rotem on #libcloud. [Tomaz Muraus]

## Compute

- Improve public and private IP address handling in OpenStack 1.1 driver. Assume every IP address which doesn't have a label "public" or "internet" is private. (LIBCLOUD-297) [Grischa Meyer, Tomaz Muraus]
- Add new driver for DigitalOcean provider https://www.digitalocean.com/. (LIBCLOUD-304) [Tomaz Muraus]
- Fix a regression in ParamikoSSHClient.run method which caused this method to only work as expected if you passed an absolute or a relative path to the script to it. (LIBCLOUD-278) [Tomaz Muraus]

### **DNS**

• Allow user to specify 'priority' extra argument when creating a MX or SRV record. [Brian Jinwright, Tomaz Muraus]

## Changes with Apache Libcloud 0.12.1

#### General

- Deprecate LazyList method of iteration over large paginated collections and use a new, more efficient generator based approach which doesn't require the iterator to be pre-exhausted and buffering all of the values in memory.
  - Existing list\_\* methods which previously used LazyList class are preserving the old behavior and new iterate\_\* methods which use a new generator based approach have been added. (LIBCLOUD-254) [Mahendra M]
- Replace old ENUM style provider constants and replace them with a string version. This change allows users to dynamically register new drivers using a new set\_driver method. (LIBCLOUD-255) [Mahendra M]
- Allow user to explicitly specify which CA file is used for verifying the server certificate by setting 'SSL\_CERT\_FILE' environment variable.
  - Note: When this variable is specified, the specified path is the only CA file which is used to verifying the server certificate. (LIBCLOUD-283) [Tomaz Muraus, Erinn Looney-Triggs]
- Add a common module (libcloud.common.xmlrpc) for handling XML-RPC requests using Libcloud http layer.

Also refactor existing drivers which use xmlrpclib directly (VCL, Gandi, Softlayer) to use this module.

This change allows drivers to support LIBCLOUD\_DEBUG and SSL certificate validation functionality. Previously they have bypassed Libcloud http layer so this functionality was not available. (LIBCLOUD-288) [John Carr]

#### Compute

- Fix string interpolation bug in \_\_repr\_\_ methods in the IBM SCE driver. (LIBCLOUD-242) [Tomaz Muraus]
- Fix test failures which happened in Python 3.3 due to: hash randomization changes in xml.etree module changes in xmlrpc module (LIBCLOUD-245) [Tomaz Muraus]
- Improvements and additions in vCloud driver:
  - Expose generic query method (ex\_query)
  - Provide functionality to get and set control access for vApps. This way created vApps can be shared between users/groups or everyone.

(LIBCLOUD-251) [Michal Galet]

- Update EC2 pricing data to reflect new, lower prices http://aws.typepad.com/aws/2012/10/new-ec2-second-generation-standard-instances-and-price-reductions-1.html [Tomaz Muraus]
- Update EC2 instance size to reflect new m3 instance types. Also refactor the code to make it easier to maintain. [Tomaz Muraus]
- Add a new driver for HostVirtual (http://www.vr.org) provider. (LIBCLOUD-249) [Dinesh Bhoopathy]
- Fix a bug where a numeric instead of a string value was used for the content-length header in VCloud driver. (LIBCLOUD-256) [Brian DeGeeter, Tomaz Muraus]
- Add a new driver for new Asia Pacific (Sydney) EC2 region. [Tomaz Muraus]
- Add support for managing security groups to the OpenStack driver. This patch adds the following extension methods: ex\_list\_security\_groups, ex\_get\_node\_security\_groups methods ex\_create\_security\_group, ex\_delete\_security\_group ex\_create\_security\_group\_rule, ex\_delete\_security\_group\_rule (LIBCLOUD-253) [L. Schaub]
- Modify ElasticStack driver class to pass 'vnc auto' instead of 'vnc:ip auto' argument to the API when creating a server. It looks like 'vnc:ip' has been replaced with 'vnc'. [Rick Copeland, Tomaz Muraus]
- Add new EC2 instance type High Storage Eight Extra Large Instance (hs1.8xlarge). [Tomaz Muraus]
- Map 'shutting-down' node state in EC2 driver to UNKNOWN. Previously it was mapped to TERMINATED. (LIBCLOUD-280)
  - Note: This change is backward incompatible which means you need to update your code if you rely on the old behavior. [Tomaz Muraus, Marcin Kuzminski]
- Change \_wait\_until\_running method so it supports waiting on multiple nodes and make it public (wait until running). (LIBCLOUD-274) [Nick Bailey]
- Add new EC2 instance type High Memory Cluster Eight Extra Large. (cr1.8xlarge). [Tomaz Muraus]
- Add new driver for Abiquo provider http://www.abiquo.com (LIBCLOUD-250). [Jaume Devesa]
- Allow user to pass 'ex\_blockdevicemappings' kwarg to the EC2 driver 'create\_node' method. (LIBCLOUD-282) [Joe Miller, Tomaz Muraus]
- Improve error handling in the Brightbox driver. [Tomaz Muraus]
- Fix the ScriptDeployment step to work correctly if user provides a relative path for the script argument. (LIBCLOUD-278) [Jaume Devesa]
- Fix Softlayer driver and make sure all the code is up to date and works with the latest version of the actual Softlayer deployment (v3). (LIBCLOUD-287) [Kevin McDonald]
- Update EC2 driver, m3 instance types are now available in all the regions except Brazil.
  - Also update pricing to reflect new (lower) prices. [Tomaz Muraus]
- Minor improvements in the HostVirtual driver and add new ex\_get\_node and ex\_build\_node extension method. (LIBCLOUD-249) [Dinesh Bhoopathy]
- Add ex\_destroy\_image method to IBM SCE driver. (LIBCLOUD-291) [Perry Zou]
- Add the following new regions to the ElasticHosts driver: sjc-c, syd-v, hkg-e. (LIBCLOUD-293) [Tomaz Muraus]
- Fix create\_node in OpenStack driver to work correctly if 'adminPass' attribute is not present in the response. [Gavin McCance, Tomaz Muraus]
- Allow users to filter images returned by the list\_images method in the EC2 driver by providing ex\_image\_ids argument. (LIBCLOUD-294) [Chris Psaltis, Joseph Hall]
- Add support for OpenNebula 3.8. (LIBCLOUD-295) [Guillaume ZITTA]

- Add missing 'deletd' -> terminated mapping to OpenStack driver. (LIBCLOUD-276) [Jayy Vis]
- Fix create\_node in OpenStack driver to work correctly if 'adminPass' attribute is not present in the response. (LIBCLOUD-292) [Gavin McCance, Tomaz Muraus]

- Add a new local storage driver. (LIBCLOUD-252, LIBCLOUD-258, LIBCLOUD-265, LIBCLOUD-273) [Mahendra M]
- Fix a bug which caused the connection to not be closed when using Python 2.6 and calling get\_object on an object which doesn't exist in the S3 driver. (LIBCLOUD-257) [John Carr]
- Add a new generator based method for listing / iterating over the containers (iterate\_containers). (LIBCLOUD-261) [Mahendra M]
- Add ex\_purge\_object\_from\_cdn method to the CloudFiles driver. (LIBCLOUD-267) [Tomaz Muraus]
- Support for multipart uploads and other improvements in the S3 driver so it can more easily be re-used with other implementations (e.g. Google Storage, etc.).
  - Also default to a multipart upload when using upload\_object\_via\_stream. This methods is more efficient compared to old approach because it only requires buffering a single multipart chunk (5 MB) in memory. (LIBCLOUD-269) [Mahendra M]
- Add new driver for Windows Azure Storage with support for block and page blobs. (LIBCLOUD-80) [Mahendra M]

#### **DNS**

- Update 'if type' checks in the update\_record methods to behave correctly if users passes in RecordType.A with a value of 0 if type is not None. (LIBCLOUD-247) [Tomaz Muraus]
- New driver for HostVirtual provider (www.vr.org). (LIBCLOUD-249) [Dinesh Bhoopathy]
- Finish Amazon Route53 driver. (LIBCLOUD-132) [John Carr]
- Add new driver for Gandi provider (https://www.gandi.net). (LIBCLOUD-281) [John Carr]

## Load-Balancer

• Add new driver for AWS Elastic Load Balancing service. (LIBCLOUD-169) [John Carr]

## Changes with Apache Libcloud 0.11.4

#### General

• Fix some of tests failures which happened in Python 3.3 due to randomized dictionary ordering. (LIBCLOUD-245) [Tomaz Muraus]

#### Compute

• Fix a bug where a numeric instead of a string value was used for the content-length header in VCloud driver. (LIBCLOUD-256) [Brian DeGeeter, Tomaz Muraus]

- Don't ignore ex\_force\_service\_region argument in the CloudFiles driver. (LIBCLOUD-260) [Dan Di Spaltro]
- Fix a bug which caused the connection to not be closed when using Python 2.6 and calling get\_object on an object which doesn't exist in the S3 driver. (LIBCLOUD-257) [John Carr]

### **DNS**

• Update 'if type' checks in the update\_record methods to behave correctly if users passes in RecordType.A with a value of 0 - if type is not None. (LIBCLOUD-247) [Tomaz Muraus]

### Changes with Apache Libcloud 0.11.3

# **Storage**

• Include 'last\_modified' and 'content\_type' attribute in the Object 'extra' dictionary when retrieving object using get\_object in the S3 driver. Also modify 'meta\_data' dictionary to include all the headers prefixed with 'x-amz-meta-'. [Tomaz Muraus]

## Changes with Apache Libcloud 0.11.2

#### General

• Fix a bug with the Libcloud SSL verification code. Code was too strict and didn't allow "-" character in the sub-domain when using a wildcard certificate.

Note: This is NOT a security vulnerability. (LIBCLOUD-244) [Tomaz Muraus]

### Compute

- Add new Rackspace Nova driver for Chicago (ORD) location (LIBCLOUD-234) [Brian McDaniel]
- Add capacity information to Vdc objects and implement power operations. (LIBCLOUD-239) [Michal Galet]
- Allow user to pass 'timeout' argument to the 'deploy\_node' method. [Tomaz Muraus]
- Add ex\_list\_security\_groups, ex\_authorize\_security\_group and ex\_describe\_all\_keypairs methods to the EC2 driver. (LIBCLOUD-241, LIBCLOUD-243) [Nick Bailey]
- Add new methods for managing storage volumes and other extensiion methods to the IBM SCE driver. (LIBCLOUD-242) [Sengor Kusturica]

#### Storage

• Add the following new methods to the CloudFiles driver: ex\_set\_account\_metadata\_temp\_url\_key, ex\_get\_object\_temp\_url. (GITHUB-72) [Shawn Smith]

### Load-balancer

• Add 'balancer' attribute to the Member instance. This attribute refers to the LoadBalancer instance this member belongs to. [Tomaz Muraus]

# Changes with Apache Libcloud 0.11.1

#### General

Fix hostname validation in the SSL verification code (CVE-2012-3446).
 Reported by researchers from the University of Texas at Austin (Martin Georgiev, Suman Jana and Vitaly Shmatikov).

## Changes with Apache Libcloud 0.11.0

### Compute

- Add a timeout of 10 seconds to OpenStackAuthConnection class. (LIBCLOUD-199) [Chris Gilmer]
- Add time.sleep(wait\_period) to \_ssh\_client\_connect to prevent busy loops when we immediately can't connect to a server. (LIBCLOUD-197) [Jay Doane]
- Fix a bug with Python 3 support in the following drivers IBM SCE, CloudStack CloudSigma OpenNebula
   VpsNet EC2 ElasticStack vCloud OpSource Slicehost Joyent (LIBCLOUD-204) [Sengor Kusturica, Hutson Betts, Tomaz Muraus]
- Make CloudStack driver more robust and make it work if list\_images() call returns no images. (LIBCLOUD-202) [Gabriel Reid]
- Add force\_ipv4 argument to \_wait\_until\_running and default it to True. This will make Libcloud ignore IPv6 addresses when using deploy\_node. (LIBCLOUD-200) [Jay Doane, Tomaz Muraus]
- Include error text if a CloudStack async job returns an error code. (LIBCLOUD-207) [Gabriel Reid]
- Add extenstion methods for block storage volume management to the CloudStack driver. (LIBCLOUD-208) [Gabriel Reid]
- New driver for KT UCloud (http://home.ucloud.olleh.com/main.kt) based on the CloudStack driver. [DaeMyung Kang]
- Add a standard API and methods for managing storage volumes to the EC2 and CloudStack drivers. Base
  API consistent of the following methods: create\_volume, destroy\_volume, attach\_volume, detach\_volume.
  (LIBCLOUD-213) [Gabriel Reid]
- Change ex\_describe\_tags, ex\_create\_tags and ex\_delete\_tags methods signature in the EC2 driver. Argument is now called resource (previously it was called node). This methods work with both Node and StorageVolume objects. (LIBCLOUD-213) [Gabriel Reid, Tomaz Muraus]
- Add Rackspace Nova London driver. [Chris Gilmer]
- Fix a bug If user doesn't pass in 'network\_id' argument to the create\_node method in the CloudStack driver, don't explicitly define it. (LIBCLOUD-219) [Bruno Mahé, Tomaz Muraus]
- Modify EC2 driver to also return cc2.8xlarge cluster compute instance in the eu-west-1 region. [Tomaz Muraus]
- Add 'auth\_user\_variable' to the OpenStackAuthConnection class. [Mark Everett]
- Fix a bug with repeated URLs in some requests the vCloud driver. (LIBCLOUD-222) [Michal Galet]

- New Gridspot driver with basic list and destroy functionality. (LIBCLOUD-223) [Amir Elaguizy]
- Add methods for managing storage volumes to the Gandi driver. (LIBCLOUD-225) [Aymeric Barantal]

### **DNS**

- Add support for GEO RecordType to Zerigo driver. (LIBCLOUD-203) [Gary Wilson]
- Fix a bug with Python 3 support in the following drivers (LIBCLOUD-204) Zerigo [Tomaz Muraus]
- Add support for URL RecordType to Zerigo driver. (LIBCLOUD-209) [Bojan Mihelac]
- Properly handle record creation when user doesn't provider a record name and wants to create a record for the actual domain. Reported by Matt Perry (LIBCLOUD-224) [Tomaz Muraus]

## **Storage**

- Fix a bug with Python 3 support in the following drivers Atmos Google Storage Amazon S3 (LIBCLOUD-204) [Tomaz Muraus]
- Fix a bug in the CloudFiles driver which prevented it to work with accounts which use a non ORD endpoint. (LIBCLOUD-205) [Geoff Greer]
- Fix a bug in the enable\_container\_cdn method. (LIBCLOUD-206) [Geoff Greer]
- Allow user to specify container CDN TTL when calling container.enable\_cd() using ex\_ttl keyword argument in the CloudFiles driver. [Tomaz Muraus]
- Add ex\_enable\_static\_website and ex\_set\_error\_page method to the CloudFiles driver. [Tomaz Muraus]
- Propagate kwargs passed to container.download\_object() to driver.download\_object(). (LIBCLOUD-227) [Benno Rice]
- Fix a bug with not escaping container and object name in the Atmos driver. [Russell Keith-Magee, Benno Rice]
- Fix upload\_object\_via\_stream method in the Atmos driver. (LIBCLOUD-228) [Benno Rice]
- Fix a bug with uploading zero-sized files in the OpenStack Swift / CloudFiles driver. [Tomaz Muraus]
- Fix a bug with content\_type and encoding of object and path names in the Atmos driver. [Russell Keith-Magee]

#### Other

• Unify docstrings formatting in the compute drivers. (LIBCLOUD-229) [Ilgiz Islamgulov]

### Changes with Apache Libcloud 0.10.1

#### General

• Add timeout attribute to base 'Connection' class and pass it to the connection class constructor if Python version is not 2.5. [Chris Gilmer]

## Compute

- Update IBM SBC driver so it works with IBM Smart Cloud Enterprise. (LIBCLOUD-195) [Sengor Kusturica]
- Add ex\_register\_iso method to the CloudStack driver. (LIBCLOUD-196) [Daemian Mack]
- Allow user to specify which IP to use when calling deploy\_node. (defaults to 'public\_ips'). Previously it only worked with public IP, now user can pass 'private\_ips' as an argument and SSH client will try to connect to the node first private IP address. [Jay Doane]
- Fix CloudSigmaLvsNodeDriver connectionCls bug. [Jerry Chen]
- Add 'ex\_keyname' argument to the create\_node method in the OpenStack driver. (LIBCLOUD-177) [Jay Doane]
- Fix a problem in deploy\_node make it work with providers which don't instantly return created node in the list\_node response. Also add \_\_str\_\_ and \_\_repr\_\_ method to DeploymentError so the error message is more useful. (LIBCLOUD-176) [Jouke Waleson, Tomaz Muraus]
- Add 'ssh\_key' feature to Brigthbox driver. This way it works with deploy\_node. (LIBCLOUD-179) [Neil Wilson]
- Add Joyent compute driver. [Tomaz Muraus]
- Store auth token expire times on the connection class in the attribute called 'auth\_token\_expires'. (LIBCLOUD-178) [Chris Gilmer, Brad Morgan]
- Add new driver for VCL cloud (http://www.educause.edu/blog/hes8/CloudComputingandtheVirtualCom/ 167931) (LIBCLOUD-180) [Jason Gionta, Tomaz Muraus]
- · Improve and add new features to Brightbox driver
  - Update fixtures to represent actual api output
  - Update compute tests to 100% coverage
  - Add userdata and server group extensions to create\_node
  - Add ipv6 support to public ip list
  - Improve in line documentation
  - Add lots of api output information to Node and Image 'extra' attributes
  - Allow variable API versions (api\_version argument)
  - Allow reverse dns updates for cloud ip extensions

(LIBCLOUD-184) [Neil Wilson, Tomaz Muraus]

- Add ex\_userdata argument to the OpenStack 1.1 driver. (LIBCLOUD-185) [Jay Doane]
- Modify Vmware vCloud driver and implement new features for the vCloud version 1.5. (LIBCLOUD-183) [Michal Galet, Sengor Kusturica]
- Allow user to pass mode argument to SSHClient.put method and default it to 'w'. (LIBCLOUD-188) [Jay Doane]
- Modify SSHKeyDeployment step to use append mode so it doesn't overwrite existing entries in .ssh/authorized keys. (LIBCLOUD-187) [Jay Doane]
- Modify ParamikoSSHClient to connect to the SSH agent and automatically look for private keys in ~/.ssh if the 'auth' and 'ssh\_key' argument is not specified when calling deploy\_node. (LIBCLOUD-182) [Tomaz Muraus]
- Add ex\_rescue and ex\_unrescue method to OpenStack 1.1 driver. (LIBCLOUD-193) [Shawn Smith]

- Include 'password' in the node extra dictionary when calling deploy\_node if the password auth is used. [Juan Carlos Moreno]
- Add FileDeployment class to libcloud.compute.deployment module. This can be used as a replacement for ex\_files argument if the provider supports deployment functionality. (LIBCLOUD-190) [Jay Doane]

- · Large object upload support for CloudFiles driver
- Add CLOUDFILES\_SWIFT driver to connect to OpenStack Swift [Dmitry Russkikh, Roman Bogorodskiy]

#### Load-balancer

- Don't include 'body\_regex' attribute in the Rackspace driver body if body\_regex is None or empty string. (LIBCLOUD-186) [Bill Woodward]
- Don't split Load balancer IP addresses into public and private list. Include all the addresses in the 'virtualIps' variable in the extra dictionary (Rackspace driver). (LIBCLOUD-191) [Adam Pickeral]

### **Changes with Apache Libcloud 0.9.1**

#### General

- Make parsing of the Auth API responses in the OpenStack drivers more flexible and extensible.
  - Now, every connection class that inherits from the openstack base connection must implement get\_endpoint(), who's job is to return the correct endpoint out of the service catalog.
  - Note: The openstack.py base driver no longer works by default with Rackspace nova. The default endpoint parsed from the service catalog is the default compute endpoint for devstack. (LIBCLOUD-151) [Brad Morgan]
- Allow user to pass ex\_tenant\_name keyword argument to the OpenStack node driver class. This scopes all the endpoints returned by the Auth API endpoint to the provided tenant. (LIBCLOUD-172) [James E. Blair]
- Allow user to specify OpenStack service catalog parameters (service type, name and region). This way base
  OpenStack driver can be used with different providers without needing to subclass. (LIBCLOUD-173) [James
  E. Blair]
- Fix a bug with handling compressed responses in the Linode driver. (LIBCLOUD-158) [Ben Agricola]

## Compute

- Add new RackspaceNovaBeta and RackspaveNovaDfw driver based on the OpenStack. (LIBCLOUD-151) [Brad Morgan]
- Include 'created' and 'updated' attribute in the OpenStack 1.1 driver. (LIBCLOUD-155) [Chris Gilmer]
- Include 'minRam' and 'minDisk' attribute in the OpenStack 1.1 driver Node extra dictionary. (LIBCLOUD-163) [Chris Gilmer]
- Allow users to use a list of tuples for the query string parameters inside the OpenStack connection classes. This way same key can be specified multiple times (LIBCLOUD-153) [Dave King]
- Allow user to pass 'max\_tries' keyword argument to deploy\_node method. [Tomaz Muraus]

- Include original exception error message when re-throwing an exception inside \_run\_deployment\_script method. [Tomaz Muraus]
- Add support for ElasticHosts new United States (Los Angeles) and Canada (Toronto) locations. (GITHUB-53) [Jaime Irurzun]
- Add serverId attribute to the NodeImage object extra dictionary in the OpenStack driver. [Mark Everett]
- Add new EC2 instance type m1.medium. [Tomaz Muraus]
- Allow user to re-use auth tokens and pass 'ex\_force\_auth\_token' keyword argument to the OpenStack driver constructor. (LIBCLOUD-164) [Dave King]
- Add new experimental libvirt driver. [Tomaz Muraus]
- Properly handle OpenStack providers which return public IP addresses under the 'internet' key in the addresses dictionary. [Tomaz Muraus]
- Update create\_node in Linode driver and make it return a Node object instead of a list. Reported by Jouke Waleson. (LIBCLOUD-175) [Tomaz Muraus]

• Don't lowercase special header names in the Amazon S3 storage driver. (LIBCLOUD-149) [Tomaz Muraus]

#### Load-balancer

- · Allow user to specify a condition and weight when adding a member in the Rackspace driver. [Adam Pickeral]
- Add an extension method (ex\_balancer\_attach\_members) for attaching multiple members to a load balancer in the Rackspace driver. (LIBCLOUD-152) [Adam Pickeral]
- Add ex\_creaate\_balancer method to the Rackspace driver and allow user to pass 'vip' argument to it. (LIBCLOUD-166) [Adam Pickeral]
- Update Rackspace driver to support Auth 2.0. (LIBCLOUD-165) [Dave King]
- Add new ex\_create\_balancer\_access\_rule and ex\_create\_balancer\_access\_rule\_no\_poll method to the Rackspace driver. (LIBCLOUD-170) [Dave King]

## **DNS**

• Update Rackspace driver to support Auth 2.0. (LIBCLOUD-165) [Dave King]

### Changes with Apache Libcloud 0.8.0

#### General

- Add 'request\_kwargs' argument to the get\_poll\_request\_kwargs method. This argument contains kwargs which were previously used to initiate the poll request. [Mark Everett]
- Add support for handling compressed responses (deflate, gzip). Also send "Accept-Encoding" "gzip,deflate" header with all the requests. [Tomaz Muraus]
- Fix debug module (LIBCLOUD\_DEBUG env variable) so it works with Python 3 [Tomaz Muraus]

## Compute

- Added support for retrieving OpenNebula v3.2 instance types, OpenNebula v3.0 network Public attribute support, and additional code coverage tests. [Hutson Betts]
- Add implementation for ex\_save\_image method to the OpenStack 1.1 driver. [Shawn Smith]
- Add support for Amazon new South America (Sao Paulo) location. [Tomaz Muraus]
- Fix a bug in OpenStack driver when 2.0\_apikey or 2.0\_password 'auth\_version' is used. [Tomaz Muraus]
- Current OpenNebula OCCI implementation does not support a proper restart method. Rather it suspends and resumes. Therefore, restart\_node has been removed from the OpenNebula driver. [Hutson Betts]
- Enable ex\_delete\_image method in the OpenStack 1.1 driver. [Shawn Smith]
- Return NodeImage instance in OpenStack 1.1 driver ex\_save\_image method (LIBCLOUD-138) [Shawn Smith]
- Enable reboot\_node method in the OpenNebula 3.2 driver. [Hutson Betts]
- Fix a public\_ips Node variable assignment in the Gandi.net driver. [Aymeric Barantal]
- Updated the list of node states for OpenNebula drivers. (LIBCLOUD-148) [Hutson Betts]

## **Storage**

• Propagate extra keyword arguments passed to the Rackspace driver connection class. [Dave King]

#### Load-balancer

- Add 'extra' attribute to the LoadBalancer object and retrieve all the virtual IP addresses in the Rackspace driver.
   [Dave King]
- Add list\_supported\_algorithms() method to the base LoadBalancer class. This method returns a list of supported algorithms by the provider. [Dave King]
- Update Rackspace driver:
  - Add two new supported algorithms: WEIGHTED\_ROUND\_ROBIN, WEIGHTED\_LEAST\_CONNECTIONS
  - Add ex\_list\_algorithm\_names method
  - Add ex\_get\_balancer\_error\_page method
  - Add ex\_balancer\_access\_list method
  - Populate LoadBalancer extra dictionary with more attributes
  - Add support for health monitors and connection throttling
  - Add more balancer states
  - ex\_list\_protocols\_with\_default\_ports

#### [Dave King]

- Propagate extra keyword arguments passed to the Rackspace driver connection class. [Dave King]
- Add 'extra' attribute to the Member object and populate it in the Rackspace driver. [Mark Everett]
- Adds status to the Member object and conditions an 'enum' (Rackspace driver). [Mark Everett]
- Add update\_balancer method to the base LoadBalancer class. [Mark Everett]

- Add update\_balancer method to the Rackspace driver. [Mark Everett]
- Add created and updated attribute to the LoadBalancer extra dictionary in the Rackspace driver. [Mark Everett]
- Fix protocol name maping in the Rackspace driver. [Bill Woodward]

## Changes with Apache Libcloud 0.7.1

#### General

- Fix a minor bug in debug mode (LIBCLOUD\_DEBUG=/dev/stderr) which has been introduced when adding Python 3 compatibility layer. [Paul Querna]
- Update OpenStack Auth API endpoint paths. [Paul Querna]

### Changes with Apache Libcloud 0.7.0

#### General

- Add support for Python 3.x. [Tomaz Muraus]
- Remove old deprecated paths. [Tomaz Muraus]

# Compute

- Update CloudSigma Zurich API endpoint address. [Tomaz Muraus]
- Add new US Las Vegas endpoint to CloudSigma driver (types.CLOUDSIGMA US) [Tomaz Muraus]
- Allow user to specify drive type (hdd, ssd) when creating a CloudSigma server.
  - Note 'ssd' drive\_type doesn't work with the API yet. [Tomaz Muraus]
- Update OpenStack 1.1 driver to comply with the API specs. Need to make another call to retrieve node name and ip addresses when creating a node, because the first call only returns an id an the password. (GITHUB-40) [Dave King]
- Add ex\_node\_ids argument to the EC2 driver list\_nodes method. (GITHUB-39) [Suvish Vt]
- If OpenStack Auth 2.0 API is used, also parse out tenant id and name and save it on the connection class (conn.tenant['id'], conn.tenant['name']). [Tomaz Muraus]
- Add new "Cluster Compute Eight Extra Large" size to the Amazon EC2 driver. [Tomaz Muraus]
- Add the following extension methods to the EC2 compute driver: ex\_describe\_all\_addresses, ex\_associate\_addresses, ex\_start\_node, ex\_stop\_node. [Suvish Vt]
- Change public\_ip and private\_ip attribute on the Node object to the public\_ips and private\_ips since both of the objects are always a list.
  - Note: For backward compatibility you can still access public\_ip and private\_ip attributes, but this will be removed in the next release. [Tomaz Muraus]
- Fix an inconsistency in IBM SBC driver and make sure public\_ips and private\_ips attributes are a list. [Tomaz Muraus]
- Fix an inconsistency in OpSource driver and make sure public\_ips is an empty list ([]), not 'unknown' [Tomaz Muraus]

• Updated support for OpenNebula.org v1.4, v2.x, and v3.x APIs and included additional compute tests validating functionality. (LIBCLOUD-121) [Hutson Betts]

#### Load-balancer

 Add ex\_member\_address argument to the Rackspace driver list\_balancers method. If this argument is provided, only loadbalancers which have a member with the provided IP address attached are returned. [Tomaz Muraus]

### Changes with Apache Libcloud 0.6.2

#### General

• Fix a bug in PollingConnection class - actually use and don't ignore the poll interval [Tomaz Muraus]

# Compute

- Add support for Auth 2.0 API (keystone) to the OpenStack Auth connection class. [Brad Morgan]
- Add list\_locations method to the OpenStack driver and fix some inconsistencies in the OpenStack driver extension method signatures. [Brad Morgan]
- Update Amazon EC2 driver and pricing data to support a new region US West 2 (Oregon) [Tomaz Muraus]
- Expose 'CLOUDSTACK' provider. This driver can be used with an arbitrary CloudStack installation. [Tomaz Muraus]

# **Storage**

• Update Amazon S3 driver to support a new region - US West 2 (Oregon) [Tomaz Muraus]

### **DNS**

- Increase the default poll interval in the Rackspace driver to 2.5 seconds. [Tomaz Muraus]
- Fix a bug in Rackspace Cloud DNS driver and make sure to throw an exception if an unexpected status code is returned. Reported by "jeblair". [Tomaz Muraus]

## **Changes with Apache Libcloud 0.6.1**

### General

- Modify ParamikoSSHClient.connect so it supports authentication using a key file, (LIBCLOUD-116) [Jay Doane]
- User must now explicitly specify a path when using LIBCLOUD\_DEBUG environment variable. (LIBCLOUD-95) [daveb, Tomaz Muraus]
- Add new XmlResponse and JsonResponse base class and modify all the driver-specific response classes to inherit from one of those two classes where applicable. [Caio Romão]
- Add new 'PollingConnection' class. This class can work with 'async' APIs. It sends and an initial request and then periodically poll the API until the job has completed or a timeout has been reached. [Tomaz Muraus]

# Compute

- Add 24GB size to the GoGrid driver [Roman Bogorodskiy]
- Fix API endpoint URL in the Softlayer driver [Tomaz Muraus]
- Add support for OpenNebula 3.0 API (LIBCLOUD-120) [Hutson Betts]
- Add more attributes to the extra dictionary in the EC2 driver. (GITHUB-31) [Juan Carlos Moreno]
- Fix IP address assignment in the EC2 driver. Don't include "None" in the public\_ip and private\_ip Node list attribute. [Tomaz Muraus]
- Make deploy\_node functionality more robust and don't start deployment if node public\_ip attribute is an empty list. [Tomaz Muraus]
- Support SSH key authentication when using deploy\_node. [Russell Haering, Tomaz Muraus]
- Enable deploy\_node functionality in the EC2 driver using SSH key authentication [Russell Haering, Tomaz Muraus]
- Enable paramiko library debug log level if LIBCLOUD\_DEBUG is used and paramiko is installed. [Tomaz Muraus]
- Fix the request signature generation in the base EC2 compute driver. If the endpoint is using a non-standard port (Eucalyptus based installations), append it to the hostname used to generate the signature. [Simon Delamare]
- Add new "unavailable" state to the BrightboxNodeDriver class. [Tim Fletcher]
- Increase a PollingConnection timeout in the CloudStack connection and fix the context dictionary creation in the \_async\_request method. [Oleg Suharev]
- Fix networks retrieval in the CloudStack driver create\_node method. Also only pass 'networkids' field to the API if there are any networks available. [Oleg Suharev, Tomaz Muraus]
- Fix list\_nodes in the CloudStack driver. Private IPs aren't always available. [Tomaz Muraus]

#### Load-baancer

- Add a missing argument to the method call inside LoadBalancer.attach\_compute\_node and Driver.balancer\_attach\_compute\_node. [Tim Fletcher, Tomaz Muraus]
- Add missing destroy() method to the LoadBalancer class. [Tomaz Muraus]

## **DNS**

- New drivers for Rackspace Cloud DNS (US and UK region) [Tomaz Muraus]
- Add list\_record\_types() method. This method returns a list of record types supported by the provider. [Tomaz Muraus]

### Changes with Apache Libcloud 0.6.0-beta1

## General

- All the driver classes now inherit from the BaseDriver class [Tomaz Muraus]
- Prefer simplejson (if available) over json module. (LIBCLOUD-112) [Geoff Greer]

- Update compute demo and change the syntax of test credentials stored in test/secrets.py-dist. (LIBCLOUD-111) [Mike Nerone]
- Enable SSL certificate verification by default and throw an exception if CA certificate files cannot be found. This can be overridden by setting libcloud.security.VERIFY\_SSL\_CERT\_STRICT to False. [Tomaz Muraus]

## Compute

- Support for 1.1 API and many other improvements in the OpenStack driver; LIBCLOUD-83 [Mike Nerone, Paul Querna, Brad Morgan, Tomaz Muraus]
- Add some extra methods to the Gandi.net driver (LIBCLOUD-115) [Aymeric Barantal]
- Add ex\_delete\_image method to the Rackspace driver. (GITHUB-27) [David Busby]
- Linode driver now supports new 'Japan' location [Jed Smith]
- Rackspace driver now inherits from the OpenStack one instead of doing it vice versa. (LIBCLOUD-110) [Mike Nerone]
- Properly populate NodeImage "details" dictionary in the Rackspace compute driver. (LIBCLOUD-107) [Lucy Mendel]
- Fix a bug in Eucalyptus driver ex\_describe\_addresses method. [Tomaz Muraus]
- Add the following new extension methods to the Rackspace driver: ex\_resize, ex\_confirm\_resize, ex\_revert\_resize. [Tomaz Muraus]
- Also allow user to pass in Node object to some ex\_methods in the Rackspace compute driver. [Tomaz Muraus]
- Throw an exception in deploy\_node if paramiko library is not available [Tomaz Muraus]
- Fix chmod argument value which is passed to the sftpclient.put method; GITHUB-17 [John Carr]
- New driver for Ninefold.com. (LIBCLOUD-98) [Benno Rice]

## **Storage**

- New driver for Google Storage based on the v1.0 / legacy API [Tomaz Muraus]
- New driver for Ninefold.com. (GITHUB-19) [Benno Rice]
- Fix a bug in uploading an object with some versions of Python 2.7 where httplib library doesn't automatically call str() on the header values. [Tomaz Muraus]
- Allow users to upload (create) 0-bytes large (empty) objects [Tomaz Muraus]

#### Load-balancer

- New driver for Rackspace UK location [Tomaz Muraus]
- New driver for Ninefold.com. (LIBCLOUD-98) [Benno Rice]

#### **DNS**

- Drivers for Linode DNS and Zerigo DNS [Tomaz Muraus]
- Brand new DNS API! [Tomaz Muraus]

## Changes with Apache Libcloud 0.5.2

## Compute

- New driver for serverlove.com and skalicloud.com [Tomaz Muraus]
- Fix node name and tag handling in the Amazon EC2 driver [Wiktor Kolodziej]
- Fix pricing and response handling in the OpenStack driver [Andrey Zhuchkov]
- Fix deploy\_node() method and make it more robust [Tomaz Muraus]
- Users can now pass file like objects to ScriptDeployment and SSHKeyDeployment constructor. [Tomaz Muraus]
- Include node tags when calling list\_nodes() in the Amazon EC2 driver [Trevor Pounds]
- Properly handle response errors in the Rackspace driver and only throw InvalidCredsError if the returned status code is 401 [Brad Morgan]
- Fix the create\_node method in the Nimbus driver and make the "ex\_create\_tag" method a no-op, because Nimbus doesn't support creating tags. [Tomaz Muraus]

## **Storage**

• Fix handling of the containers with a lot of objects. Now a LazyList object is returned when user calls list\_container\_objects() method and this object transparently handles pagination. [Danny Clark, Wiktor Kolodziej]

### Changes with Apache Libcloud 0.5.0

- Existing APIs directly on the libcloud.\* module have been deprecated and will be removed in version 0.6.0. Most methods were moved to the libcloud.compute.\* module.
- Add new libcloud.loadbalancers API, with initial support for:
  - GoGrid Load Balancers
  - Rackspace Load Balancers

[Roman Bogorodskiy]

- · Add new libcloud.storage API, with initial support for:
  - Amazon S3
  - Rackspace CloudFiles

[Tomaz Muraus]

- Add new libcloud.compute drivers for:
  - Bluebox [Christian Paredes]
  - Gandi.net [Aymeric Barantal]
  - Nimbus [David LaBissoniere]
  - OpenStack [Roman Bogorodskiy]
  - Opsource.net [Joe Miller]
- Added "pricing" module and improved pricing handling. [Tomaz Muraus]

### • Updates to the GoGrid compute driver:

- Use API version 1.0.
- Remove sandbox flag.
- Add ex\_list\_ips() to list IP addresses assigned to the account.
- Implement ex\_edit\_image method which allows changing image attributes like name, description and make image public or private.

## [Roman Bogorodskiy]

## • Updates to the Amazon EC2 compute driver:

- When creating a Node, use the name argument to set a Tag with the value. [Tomaz Muraus]
- Add extension method for modifying node attributes and changing the node size. [Tomaz Muraus]
- Add support for the new Amazon Region (Tokyo). [Tomaz Muraus]
- Added ex\_create\_tags and ex\_delete\_tags. [Brandon Rhodes]
- Include node Elastic IP addresses in the node public\_ip attribute for the EC2 nodes. [Tomaz Muraus]
- Use ipAddress and privateIpAddress attribute for the EC 2node public and private ip. [Tomaz Muraus]
- Add ex\_describe\_addresses method to the EC2 driver. [Tomaz Muraus]

## • Updates to the Rackspace CloudServers compute driver:

- Add ex rebuild() and ex get node details() [Andrew Klochkov]
- Expose URI of a Rackspace node to the node meta data. [Paul Querna]
- Minor fixes to get the library and tests working on Python 2.7 and PyPy. [Tomaz Muraus]

#### Changes with Apache Libcloud 0.4.2 (Released January 18, 2011)

- Fix EC2 create\_node to become backward compatible for NodeLocation. [Tomaz Muraus]
- Update code for compatibility with CPython 2.5 [Jerry Chen]
- Implement ex\_edit\_node method for GoGrid driver which allows changing node attributes like amount of RAM or description. [Roman Bogorodskiy]
- Add ex\_set\_password and ex\_set\_server\_name to Rackspace driver. [Peter Herndon, Paul Querna]
- Add Hard and Soft reboot methods to Rackspace driver. [Peter Herndon]
- EC2 Driver availability zones, via ex\_list\_availability\_zones; list\_locations rewrite to include availability zones [Tomaz Muraus]
- EC2 Driver Idempotency capability in create\_node; LIBCLOUD-69 [David LaBissoniere]

#### • SSL Certificate Name Verification:

- libcloud.security module
- LibcloudHTTPSConnection, LibcloudHTTPConnection (alias)
- Emits warning when not verifying, or CA certs not found
- Append ORD1 to available Rackspace location, but keep in the same node as DFW1, because it's not readable or writeable from the API. [Per suggestion of Grig Gheorghiu]
- ex\_create\_ip\_group, ex\_list\_ip\_groups, ex\_delete\_ip\_group, ex\_share\_ip, ex\_unshare\_ip, ex\_list\_ip\_addresses additions to Rackspace driver [Andrew Klochkov]

- New driver for CloudSigma. [Tomaz Muraus]
- New driver for Brightbox Cloud. (LIBCLOUD-63) [Tim Fletcher]
- Deployment capability to ElasticHosts [Tomaz Muraus]
- Allow deploy\_node to use non-standard SSH username and port [Tomaz Muraus]
- Added Rackspace UK (London) support [Chmouel Boudinah]
- GoGrid driver: add support for locations, i.e. listing of locations and creation of a node in specified location [Roman Bogorodskiy]
- GoGrid and Rackspace drivers: add ex\_save\_image() extra call to convert running node to an image [Roman Bogorodskiy]
- GoGrid driver: add support for creating 'sandbox' server and populate isSandbox flag in node's extra information. [Roman Bogorodskiy]
- Add ImportKeyPair and DescribeKeyPair to EC2. (LIBCLOUD-62) [Philip Schwartz]
- Update EC2 driver and test fixtures for new API. [Philip Schwartz]

## Changes with Apache Libcloud 0.4.0 [Released October 6, 2010]

- Add create keypair functionality to EC2 Drivers. (LIBCLOUD-57) [Grig Gheorghiu]
- Improve handling of GoGrid accounts with limited access API keys. [Paul Querna]
- New Driver for ElasticHosts. (LIBCLOUD-45) [Tomaz Muraus]
- Use more consistent name for GoGrid driver and use http POST method for 'unsafe' operations [Russell Haering]
- Implement password handling and add deployment support for GoGrid nodes. [Roman Bogorodskiy]
- Fix behavior of GoGrid's create\_node to wait for a Node ID. [Roman Bogorodskiy]
- Add ex\_create\_node\_nowait to GoGrid driver if you don't need to wait for a Node ID when creating a node. [Roman Bogorodskiy]
- Removed libcloud.interfaces module. [Paul Querna]
- Removed dependency on zope.interfaces. [Paul Querna]
- RimuHosting moved API endpoint address. [Paul Querna]
- Fix regression and error in GoGrid driver for parsing node objects. [Roman Bogorodskiy]
- Added more test cases for GoGrid driver. (LIBCLOUD-34) [Roman Bogorodskiy, Jerry Chen]
- Fix parsing of Slicehost nodes with multiple Public IP addresses. [Paul Querna]
- Add exit\_status to ScriptDeployment. (LIBCLOUD-36) [Paul Querna]
- Update prices for several drivers. [Brad Morgan, Paul Querna]
- Update Linode driver to reflect new plan sizes. [Jed Smith]
- Change default of 'location' in Linode create\_node. (LIBCLOUD-41) [Jed Smith, Steve Steiner]
- Document the Linode driver. [Jed Smith]
- Request a private, LAN IP address at Linode creation. [Jed Smith]

## Changes with Apache Libcloud 0.3.1 [Released May 11, 2010]

- Updates to Apache License blocks to correctly reflect status as an Apache Project.
- Fix NOTICE file to use 2010 copyright date.
- Improve error messages for when running the test cases without first setting up a secrets.py

## Changes with Apache Libcloud 0.3.0 [Tagged May 6, 2010, not released]

- New Drivers for:
  - Dreamhost
  - Eucalyptus
  - Enomaly ECP
  - IBM Developer Cloud
  - OpenNebula
  - SoftLayer
- · Added new deployment and bootstrap API.
- Improved Voxel driver.
- Added support for Amazon EC2 Asia Pacific (Singapore) Region.
- Improved test coverage for all drivers.
- Add support for multiple security groups in EC2.
- Fixed bug in Rackspace and RimuHosting when using multiple threads.
- Improved debugging and logging of HTTP requests.
- Improved documentation for all classes and methods.

## Changes with Apache Libcloud 0.2.0 [Tagged February 2, 2010]

• First public release.

## 1.4.2 Upgrade Notes

This page describes how to upgrade from a previous version to a new version which contains backward incompatible or semi-incompatible changes and how to preserve the old behavior when this is possible.

#### Libcloud 3.7.0

• Support for Python 3.6 which has been EOL for more than a year now has been removed.

If you still want to use Libcloud with Python 3.6, you should use an older release which still supports Python 3.6.

### Libcloud 3.6.0

Compatibility layer has been introduced for paramiko SSH based deployment functionality.

paramiko v2.9.0 introduced a change to prefer SHA-2 variants of RSA key verification algorithm (https://github.com/paramiko/paramiko/blob/2.9.0/sites/www/changelog.rst#changelog). With this version paramiko would fail to connect to older OpenSSH servers which don't support this algorithm (e.g. default setup on Ubuntu 14.04) and throw authentication error.

The code has been updated to be backward compatible. It first tries to connect to the server using default preferred algorithm values and in case that fails, it will fall back to the old approach with SHA-2 variants disabled.

This functionality can be disabled by setting LIBCLOUD\_PARAMIKO\_SHA2\_BACKWARD\_COMPATIBILITY``environmen variable to ``false.

For security reasons (to prevent possible downgrade attacks and similar) you are encouraged to do that in case you know you won't be connecting to any old

#### Libcloud 3.5.0

- Support for Python 3.5 which has been EOL for more than a year now has been removed.
  - If you still want to use Libcloud with Python 3.5, you should use an older release which still supports Python 3.5.
- The OpenStack compute driver has moved the floating ip related functions from nova to neutron. This change affects all the floating ip related functions of the OpenStack\_2\_NodeDriver class. Two new classes have been added OpenStack\_2\_FloatingIpPool and OpenStack\_2\_FloatingIpAddress. The main change applies to the FloatingIP class where node\_id property cannot be directly obtained from FloatingIP information and it must be gotten from the related Port information with the get\_node\_id() method.

### Libcloud 3.4.0

Exception message changed in OpenStack drivers

Attempting to use an identity API that requires authentication without an authentication token raises a ValueError. The exception message used to be "Not to be authenticated to perform this request", but has now been changed to "Need to be authenticated to perform this request".

• Code which retries HTTP requests on 429 rate limit reached status code has been updated to respect timeout argument and stop retrying if timeout has been reached.

Previously if API kept returning 429 status code back to the client, the code would try to retry for ever and in some scenarios when Retry-After value is not available in the response headers, also use 0 seconds for the sleep / retry delay which would cause busy waiting.

If you want to preserve old behavior, you can do that by setting retryCls variable on the driver connection instance to RetryForeverOnRateLimitError as shown below.:

```
from libcloud.utils.retry import RetryForeverOnRateLimitError
driver.connection.retryCls = RetryForeverOnRateLimitError
...
```

#### Libcloud 3.3.0

 libcloud.pricing.get\_size\_pricing() now only caches pricing data in memory for the requested drivers.

This way we avoid unnecessary overhead of caching data in memory for all the drivers.

If you want to revert to the old behavior (cache pricing data for all the drivers in memory), you can do that by passing cache\_all=True argument to that function as shown below:

```
from libcloud.pricing import get_size_pricing
price = get_size_price("compute", "bluebox", cache_all=True)
```

Or by setting libcloud.pricing.CACHE ALL PRICING DATA module level variable to True:

```
import libcloud.pricing
libcloud.pricing.CACHE_ALL_PRICING_DATA = True

# Your code here
# ...
```

Passing cache\_all=True might come handy in situations where you know the application will work with a lot of different drivers - this way you can avoid multiple disk reads when requesting pricing data for different drivers.

• Packet driver has been renamed to Equinix Metal. Provider name has changed from Provider.PACKET to Provider.EQUINIXMETAL, while everything else works as before.

Before:

```
from libcloud.compute.types import Provider
from libcloud.compute.providers import get_driver

cls = get_driver(Provider.PACKET)
driver = cls('api_key')
```

After:

```
from libcloud.compute.types import Provider
from libcloud.compute.providers import get_driver

cls = get_driver(Provider.EQUINIXMETAL)
driver = cls('api_key')
```

• New libcloud.common.base.ALLOW\_PATH\_DOUBLE\_SLASHES module level variable has been added which defaults to False for backward compatibility reasons.

When set to True, Libcloud code won't perform any URL path sanitization and will allow URL paths with double slashes (e.g. /my-bucket//foo/1.txt).

This may come handy to the users who have S3 paths which contains double slashes or similar and are upgrading from Libcloud v2.3.0 or older where no path sanitization was performed.

Example S3 bucket layout with this option disabled (default) and enabled.

Object with the following name: /my-bucket/sub-directory/file.txt

```
# Disabled

root
+-- my-bucket/
    +-- sub-directory/
     +-- file.txt

# Enabled

root
+-- /
    +-- my-bucket/
     +-- sub-directory/
     +-- file.txt
```

Object with the following name: /my-bucket//directory1/file.txt

```
# Disabled

root
+-- my-bucket/
    +-- directory1/
     +-- file.txt

# Enabled

root
+-- /
    +-- my-bucket/
    +-- /
     +-- directory1/
     +-- file.txt
```

As you can see from the examples above, directory layout is not the same with this option enabled and disabled so you should be careful when you use it.

This change affects all the drivers which are used when that module level variable is set.

### Libcloud 3.2.0

• To accommodate for more complex pricing schemes, pricing data format for AWS EC2 inside libeloud/data/pricing.json file has changes.

Previously, it contained a mapping of <driver name>\_<driver rigion> -> <instance size> -> <price> and now the pricing is in the following format: ec\_{linux, windows} -> <instance size> -> <region> -> <price>.

This format gives us more flexibility for more complex pricing schemes and also allows us to store prices for non-Linux instances.

### Libcloud 3.0.0

• This release drops support for Python versions older than 3.5.0.

If you still need to use Libcloud with Python 2.7 or Python 3.4 you can do that by using the latest release which still supported those Python versions (Libcloud v2.8.0).

- This release removes VMware vSphere driver which relied on old and unmaintained pysphere library which doesn't support Python 3.
- This release removes support for PageBlob objects from the Azure Blobs storage driver. The ex\_blob\_type and ex\_page\_blob\_size arguments have been removed from the upload\_object and upload\_object\_via\_stream methods.
- The ex\_prefix keyword argument in the iterate\_container\_objects and list\_container\_objects methods in all storage drivers has been renamed to prefix to indicate the promotion of the argument to the standard storage driver API.

#### Libcloud 2.8.0

- deploy\_node () method in the GCE driver has been updated so it complies with the base compute API.
  - This means that the method now takes the same argument as the base deploy\_node() method (deployment, ssh\_username, ssh\_port, etc.) plus all the keyword arguments which are supported by the create\_node() method.
- group\_name keyword argument in the create\_node() method in the Abiquo driver has been renamed to ex\_group\_name to comply with the convention for naming non-standard arguments (arguments which are not part of the standard compute API).

#### Libcloud 2.7.0

• AWS S3 driver has moved from "driver class per region" model to "single driver class with region constructor argument" model. This means this driver now follows the same approach as other multi region drivers.

Before:

```
from libcloud.storage.types import Provider
from libcloud.storage.providers import get_driver

S3_EU_CENTRAL = get_driver(Provider.S3_EU_CENTRAL)
S3_EU_WEST_1 = get_driver(Provider.S3_EU_WEST)

driver_eu_central = S3_EU_CENTRAL('api key', 'api secret')
driver_eu_west_1 = S3_EU_WEST_1('api key', 'api secret')
```

After:

```
from libcloud.storage.types import Provider
from libcloud.storage.providers import get_driver

S3 = get_driver(Provider.S3)

driver_eu_central = S3('api key', 'api secret', region='eu-central-1')
driver_eu_west_1 = S3('api key', 'api secret', region='eu-west-1')
```

For now, old approach will still work, but it will be deprecated and fully removed in a future release. Deprecation and removal will be announced well in advance.

 New start\_node and stop\_node methods have been added to the base Libcloud compute API NodeDriver class.

A lot of the existing compute drivers already implemented that functionality via extension methods (ex\_start\_node, ex\_stop\_node) so it was decided to promote those methods to be part of the standard Libcloud compute API and update all the affected drivers.

For backward compatibility reasons, existing ex\_start and ex\_stop\_node methods will still work until a next major release.

If you are relying on code which uses ex\_start and ex\_stop\_node methods, you are encouraged to update it to utilize new start\_node and stop\_node methods since those ex\_ methods are now deprecated and will be removed in a future major release.

#### Libcloud 1.0.0

 Per-region provider constants and related driver classes which have been deprecated in Libcloud 0.14.0 have now been fully removed.

Those provider drivers have moved to the single provider constant + region constructor argument in Libcloud 0.14.0.

#### Libcloud 0.20.0

• New optional ttl argument has been added to libcloud.dns.base.Record class constructor before the existing extra argument.

If you have previously manually instantiated this class and didn't use keyword arguments, you need to update your code to correctly pass arguments to the constructor (you are encouraged to use keyword arguments to avoid such issues in the future).

 All NodeState, StorageVolumeState, VolumeSnapshotState and Provider attributes are now strings instead of integers.

If you are using the tostring and fromstring methods of NodeState, you are fine. If you are using NodeState.RUNNING and the like, you are also fine.

However, if you have previously depended on these being integers, you need to update your code to depend on strings. You should consider starting using the tostring and fromstring methods as the output of these functions will not change in future versions, while the implementation might.

## Libcloud 0.19.0

- The base signature of NodeDriver.create\_volume has changed. The snapshot argument is now expected to be a VolumeSnapshot instead of a string. The older signature was never correct for built-in drivers, but custom drivers may break. (GCE accepted strings, names or None and still does. Other drivers did not implement creating volumes from snapshots at all until now.)
- VolumeSnapshots now have a *created* attribute that is a *datetime* field showing the creation datetime of the snapshot. The field in VolumeSnapshot.extra containing the original string is maintained, so this is a backwardscompatible change.
- The OpenStack compute driver methods ex\_create\_snapshot and ex\_delete\_snapshot are now deprecated by the standard methods create\_volume\_snapshot and destroy\_volume\_snapshot. You should update your code.
- The compute base driver now considers the name argument to create\_volume\_snapshot to be optional. All official implementations of this methods already considered it optional. You should update any custom drivers if they rely on the name being mandatory.

#### Libcloud 0.16.0

## Changes in the OpenStack authentication and service catalog classes

**Note:** If you are only working with the driver classes and have never dorectly touched the classes mentioned below, then you aren't affected and those changes are fully backward compatible.

To make OpenStack authentication and identity related classes more extensible, easier to main and easier to use, those classes have been refactored. All of the changes are described below.

- New libcloud.common.openstack\_identity module has been added. This module contains code for working with OpenStack Identity (Keystone) service.
- OpenStackAuthConnection class has been removed and replaced with one connection class per Keystone API version (OpenStackIdentity\_1\_0\_Connection, OpenStackIdentity\_2\_0\_Connection, OpenStackIdentity\_3\_0\_Connection).
- New get\_auth\_class method has been added to OpenStackBaseConnection class. This method allows you to retrieve an instance of the authentication class which is used with the current connection.
- OpenStackServiceCatalog class has been refactored to store parsed catalog entries in a structured format (OpenStackServiceCatalogEntry and OpenStackServiceCatalogEntryEndpoint class). Previously entries were stored in an unstructured form in a dictionary. All the catalog entries can be retrieved by using OpenStackServiceCatalog.get\_entris method.
- ex\_force\_auth\_version argument in OpenStackServiceCatalog constructor method has been renamed to auth version
- get\_regions, get\_service\_types and get\_service\_names methods on the OpenStackServiceCatalog class have been modified to always return the result in the same order (result values are sorted beforehand).

For more information and examples, please refer to the Libcloud now supports OpenStack Identity (Keystone) API v3 blog post.

#### Libcloud 0.14.1

### Fix record name inconsistencies in the Rackspace DNS driver

Record. name attribute is now correctly set to None for records which refer to the bare domain name. Previously, Record. name attribute for such records was set to the domain name.

For example, lets have a look at a record which points to the domain example.com.

New Record. name attribute value for such record: None

Old Record. name attribute value for such record: example.com

This was done to make the Rackspace driver consistent with the other ones.

#### Libcloud 0.14.0

To make drivers with multiple regions easier to use, one of the big changes in this version is move away from the old "one class per region" model to a new single class plus region argument model.

More information on how this affects existing drivers and your code can be found below.

## Default Content-Type is now provided if none is supplied and none can be guessed

In older versions, Libcloud would throw an exception when a content type is not supplied and none can't be automatically detected when uploading an object.

This has changed with the 0.14.0 release. Now if no content type is specified and none can't be detected, a default content type of application/octet-stream is used.

If you want to preserve the old behavior, you can set strict mode attribute on the driver object to True.

```
from libcloud.storage.types import Provider
from libcloud.storage.providers import get_driver

cls = get_driver(Provider.CLOUDFILES)
driver = cls('username', 'api key')

driver.strict_mode = True
```

If you are not using strict mode and you are uploading a binary object, we still encourage you to practice Python's "explicit is better than implicit" mantra and explicitly specify Content-Type of application/octet-stream.

## SSH Key pair management functionality has been promoted to the base API

SSH key pair management functionality has been promoted to be a part of the base compute API.

As such, the following new classes and methods have been added:

- libcloud.compute.base.KeyPair
- libcloud.compute.base.NodeDriver.list\_key\_pairs
- libcloud.compute.base.NodeDriver.create\_key\_pair
- libcloud.compute.base.NodeDriver.import\_key\_pair\_from\_string
- libcloud.compute.base.NodeDriver.import\_key\_pair\_from\_file
- libcloud.compute.base.NodeDriver.delete\_key\_pair

Previously, this functionality was available in some of the provider drivers (CloudStack, EC2, OpenStack) via the following extension methods:

- ex\_list\_keypairs
- ex\_create\_keypair
- ex\_import\_keypair\_from\_string
- ex\_import\_keypair
- ex\_delete\_keypair

Existing extension methods will continue to work until the next major release, but you are strongly encouraged to start using new methods which are now part of the base compute API and are guaranteed to work the same across different providers.

## New default kernel versions used when creating Linode servers

Kernel versions which are used by default when creating Linode servers have been updated.

Old default kernel versions:

- x86 (no paravirt-ops) 2.6.18.8-x86\_64-linode1 (#60)
- x86 (paravirt-ops) 2.6.18.8-x86\_64-linode1 (#110)
- x86\_64 (no paravirt-ops) 2.6.39.1-linode34 (#107)
- x86 (paravirt-ops)64 2.6.18.8-x86\_64-linode1 (#111)

New default kernel versions:

- x86 3.9.3 x86 linode 52 (#137)
- x86\_64-3.9.3-x86\_64-linode33 (#138)

Those new kernel versions now come with paravirt-ops by default.

If you want to preserve the old behavior, you can pass ex\_kernel argument to the create\_node method.

Keep in mind that using old kernels is strongly discouraged since they contain known security holes.

For example:

```
from libcloud.compute.types import Provider
from libcloud.compute.providers import get_driver

cls = get_driver(Provider.LINODE)

driver = cls('username', 'api_key')
driver.create_node(..., ex_kernel=110)
```

### Addition of new "STOPPED" node state

This version includes a new state called libcloud.compute.types.NodeState.STOPPED. This state represents a node which has been stopped and can be started later on (unlike TERMINATED state which represents a node which has been terminated and can't be started later on).

As such, EC2 and HostVirual drivers have also been updated to recognize this new state.

Before addition of this state, nodes in this state were mapped to NodeState.UNKNOWN.

### Amazon EC2 compute driver changes

Amazon EC2 compute driver has moved to single class plus region argument model. As such, the following provider constants have been deprecated:

- EC2\_US\_EAST
- EC2\_US\_WEST\_OREGON
- EC2\_EU
- EC2\_EU\_WEST
- EC2\_AP\_SOUTHEAST
- EC2\_AP\_SOUTHEAST2
- EC2\_AP\_NORTHEAST
- EC2\_SA\_EAST

And replaced with a single constant:

• EC2 - Supported values for the region argument are: us-east-1, us-west-1, us-west-2, eu-west-1, ap-southeast-1, ap-northeast-1, sa-east-1, ap-southeast-2. Default value is us-east-1.

List which shows how old classes map to a new region argument value:

```
EC2_US_EAST -> us-east-1
EC2_US_WEST -> us-west-1
EC2_US_WEST_OREGON -> us-west-2
EC2_EU -> eu-west-1
EC2_EU_WEST -> eu-west-1
```

- EC2\_AP\_SOUTHEAST -> ap-southeast-1
- -
- EC2\_AP\_SOUTHEAST2 -> ap-southeast-2
- EC2\_AP\_NORTHEAST -> ap-northeast-1
- EC2\_SA\_EAST -> sa-east-1

#### Old code:

```
from libcloud.compute.types import Provider
from libcloud.compute.providers import get_driver

cls1 = get_driver(Provider.EC2)
cls2 = get_driver(Provider.EC2_EU_WEST)

driver1 = cls('username', 'api_key')
driver2 = cls('username', 'api_key')
```

#### New code:

```
from libcloud.compute.types import Provider
from libcloud.compute.providers import get_driver

cls = get_driver(Provider.EC2)

driver1 = cls('username', 'api_key', region='us-east-1')
driver2 = cls('username', 'api_key', region='eu-west-1')
```

### Rackspace compute driver changes

Rackspace compute driver has moved to single class plus region argument model. As such, the following provider constants have been **removed**:

• RACKSPACE

- RACKSPACE\_UK
- RACKSPACE\_AU
- RACKSPACE\_NOVA\_ORD
- RACKSPACE\_NOVA\_DFW
- RACKSPACE\_NOVA\_LON
- RACKSPACE\_NOVA\_BETA

And replaced with two new constants:

- RACKSPACE\_FIRST\_GEN Supported values for region argument are: us, uk. Default value is us.
- RACKSPACE Supported values for the region argument are: dfw, ord, iad, lon, syd, hkg. Default value is dfw.

Besides that, RACKSPACE provider constant now defaults to next-generation OpenStack based servers. Previously it defaulted to first generation cloud servers.

If you want to preserve old behavior and use first-gen drivers you need to use RACKSPACE\_FIRST\_GEN provider constant.

First generation cloud servers now also use auth 2.0 by default. Previously they used auth 1.0.

Because of the nature of this first-gen to next-gen change, old constants have been fully removed and unlike region changes in other driver, this change is not backward compatible.

List which shows how old, first-gen classes map to a new region argument value:

- RACKSPACE -> us
- RACKSPACE\_UK -> uk

List which shows how old, next-gen classes map to a new region argument value:

- RACKSPACE\_NOVA\_ORD -> ord
- RACKSPACE\_NOVA\_DFW -> dfw
- RACKSPACE\_NOVA\_LON -> lon
- RACKSPACE AU -> syd

More examples which show how to update your code to work with a new version can be found below.

Old code (connecting to a first-gen provider):

```
from libcloud.compute.types import Provider
from libcloud.compute.providers import get_driver

cls1 = get_driver(Provider.RACKSPACE) # US regon
cls2 = get_driver(Provider.RACKSPACE_UK) # UK regon

driver1 = cls('username', 'api_key')
driver2 = cls('username', 'api_key')
```

New code (connecting to a first-gen provider):

```
from libcloud.compute.types import Provider
from libcloud.compute.providers import get_driver

cls = get_driver(Provider.RACKSPACE_FIRST_GEN)

driver1 = cls('username', 'api_key', region='us')
driver2 = cls('username', 'api_key', region='uk')
```

Old code (connecting to a next-gen provider)

```
from libcloud.compute.types import Provider
from libcloud.compute.providers import get_driver

cls1 = get_driver(Provider.RACKSPACE_NOVA_ORD)
```

(continues on next page)

(continued from previous page)

```
cls2 = get_driver(Provider.RACKSPACE_NOVA_DFW)
cls3 = get_driver(Provider.RACKSPACE_NOVA_LON)

driver1 = cls('username', 'api_key')
driver2 = cls('username', 'api_key')
driver3 = cls('username', 'api_key')
```

New code (connecting to a next-gen provider)

```
from libcloud.compute.types import Provider
from libcloud.compute.providers import get_driver

cls = get_driver(Provider.RACKSPACE)

driver1 = cls('username', 'api_key', region='ord')
driver2 = cls('username', 'api_key', region='dfw')
driver3 = cls('username', 'api_key', region='lon')
```

### CloudStack compute driver changes

CloudStack driver received a lot of changes and additions which will make it more pleasant to use. Backward incompatible changes are listed below:

- CloudStackForwardingRule class has been renamed to CloudStackIPForwardingRule
- create\_node method arguments are now more consistent with other drivers. Security groups are now passed as ex\_security\_groups, SSH keypairs are now passed as ex\_keyname and userdata is now passed as ex\_userdata.
- For advanced networking zones, multiple networks can now be passed to the <code>create\_node</code> method instead of a single network id. These networks need to be instances of the <code>CloudStackNetwork</code> class.
- The extra\_args argument of the create\_node method has been removed. The only arguments accepted are now the defaults name, size, image, location plus ex\_keyname, ex\_userdata, ex\_security\_groups and networks.

### Joyent compute driver changes

Joyent driver has been aligned with other drivers and now the constructor takes region instead of location argument.

For backward compatibility reasons, old argument will continue to work until the next major release.

Old code:

```
from libcloud.compute.types import Provider
from libcloud.compute.providers import get_driver

cls = get_driver(Provider.JOYENT)

driver = cls('username', 'api_key', location='us-east-1')
```

Old code:

```
from libcloud.compute.types import Provider
from libcloud.compute.providers import get_driver

cls = get_driver(Provider.JOYENT)

driver = cls('username', 'api_key', region='us-east-1')
```

## ElasticHosts compute driver changes

ElasticHosts compute driver has moved to single class plus region argument model. As such, the following provider constants have been deprecated:

- ELASTICHOSTS\_UK1
- ELASTICHOSTS\_UK1
- ELASTICHOSTS\_US1
- ELASTICHOSTS\_US2
- ELASTICHOSTS US3
- ELASTICHOSTS\_CA1
- ELASTICHOSTS AU1
- ELASTICHOSTS\_CN1

And replaced with a single constant:

• ELASTICHOSTS - Supported values for the region argument are: lon-p, lon-b, sat-p, lax-p, sjc-c, tor-p, syd-y, cn-1 Default value is sat-p.

List which shows how old classes map to a new region argument value:

- ELASTICHOSTS\_UK1 -> lon-p
- ELASTICHOSTS\_UK1 -> lon-b
- ELASTICHOSTS\_US1 -> sat-p
- ELASTICHOSTS\_US2 -> lax-p
- ELASTICHOSTS\_US3 -> sjc-c
- ELASTICHOSTS\_CA1 -> tor-p
- ELASTICHOSTS\_AU1 -> syd-y
- ELASTICHOSTS CN1 -> cn-1

Because of this change main driver class has also been renamed from libcloud.compute. drivers.elastichosts.ElasticHostsBaseNodeDriver to libcloud.compute.drivers.elastichosts.ElasticHostsNodeDriver.

Only users who directly instantiate a driver and don't use recommended get\_driver method are affected by this change.

Old code:

```
from libcloud.compute.types import Provider
from libcloud.compute.providers import get_driver

cls1 = get_driver(Provider.ELASTICHOSTS_UK1)
cls2 = get_driver(Provider.ELASTICHOSTS_US2)

driver1 = cls('username', 'api_key')
driver2 = cls('username', 'api_key')
```

#### New code:

```
from libcloud.compute.types import Provider
from libcloud.compute.providers import get_driver

cls = get_driver(Provider.ELASTICHOSTS)

driver1 = cls('username', 'api_key', region='lon-p')
driver2 = cls('username', 'api_key', region='lax-p')
```

## Unification of extension arguments for security group handling in the EC2 driver

To unify extension arguments for handling security groups between drivers, ex\_securitygroup argument in the EC2 create\_node method has been renamed to ex\_security\_groups.

For backward compatibility reasons, old argument will continue to work for until a next major release.

### CloudFiles Storage driver changes

CLOUDFILES\_UK and CLOUDFILES\_UK provider constants have been deprecated and a new CLOUDFILES constant has been added.

User can now use this single constant and specify which region to use by passing region argument to the driver constructor.

Old code:

```
from libcloud.storage.types import Provider
from libcloud.storage.providers import get_driver

cls1 = get_driver(Provider.CLOUDFILES_US)
cls2 = get_driver(Provider.CLOUDFILES_UK)

driver1 = cls1('username', 'api_key')
driver2 = cls1('username', 'api_key')
```

#### New code:

```
from libcloud.compute.types import Provider
from libcloud.compute.providers import get_driver

cls = get_driver(Provider.CLOUDFILES)

driver1 = cls1('username', 'api_key', region='dfw')
driver2 = cls1('username', 'api_key', region='lon')
```

## **Rackspace DNS driver changes**

Rackspace DNS driver has moved to one class plus region argument model. As such, the following provider constants have been deprecated:

- RACKSPACE\_US
- RACKSPACE\_UK

And replaced with a single constant:

• RACKSPACE - Supported values for region arguments are us, uk. Default value is us.

#### Old code:

```
from libcloud.dns.types import Provider
from libcloud.dns.providers import get_driver

cls1 = get_driver(Provider.RACKSPACE_US)
cls2 = get_driver(Provider.RACKSPACE_UK)

driver1 = cls1('username', 'api_key')
driver2 = cls1('username', 'api_key')
```

#### New code:

```
from libcloud.dns.types import Provider
from libcloud.dns.providers import get_driver

cls = get_driver(Provider.RACKSPACE)

driver1 = cls1('username', 'api_key', region='us')
driver2 = cls1('username', 'api_key', region='uk')
```

### Rackspace load balancer driver changes

Rackspace loadbalancer driver has moved to one class plus region argument model. As such, the following provider constants have been deprecated:

- RACKSPACE\_US
- RACKSPACE\_UK

And replaced with a single constant:

• RACKSPACE - Supported values for region arguments are dfw, ord, iad, lon, syd, hkg. Default value is dfw.

#### Old code:

```
from libcloud.loadbalancer.types import Provider
from libcloud.loadbalancer.providers import get_driver

cls1 = get_driver(Provider.RACKSPACE_US)
cls2 = get_driver(Provider.RACKSPACE_UK)

driver1 = cls1('username', 'api_key')
driver2 = cls1('username', 'api_key')
```

New code:

```
from libcloud.loadbalancer.types import Provider
from libcloud.loadbalancer.providers import get_driver

cls = get_driver(Provider.RACKSPACE)

driver1 = cls1('username', 'api_key', region='ord')
driver2 = cls1('username', 'api_key', region='lon')
```

# ScriptDeployment and ScriptFileDeployment constructor now takes args argument

libcloud.compute.deployment.ScriptDeployment and libcloud.compute.deployment. ScriptFileDeployment class constructor now take args as a second argument.

Previously this argument was not present and the second argument was name.

If you have a code which instantiate those classes directly and passes two or more arguments (not keyword arguments) to the constructor you need to update it to preserve the old behavior.

Old code:

```
sd = ScriptDeployment('#!/usr/bin/env bash echo "ponies!"', 'ponies.sh')
```

#### New code:

Even better (using keyword arguments):

## **Pricing data changes**

By default this version of Libcloud tries to read pricing data from the ~/.libcloud/pricing.json file. If this file doesn't exist, Libcloud falls back to the old behavior and the pricing data is read from the pricing file which is shipped with each release.

For more information, please see using-custom-pricing-file page.

## RecordType ENUM value is now a string

libcloud.dns.types.RecordType ENUM value used be an integer, but from this version on, it's now a string. This was done to make it simpler and remove unnecessary indirection.

If you use *RecordType* class in your code as recommended, no changes are required, but if you use integer values directly, you need to update your code to use *RecordType* class otherwise it will break.

OK:

#### Not OK:

### Cache busting functionality is now only enabled in Rackspace first-gen driver

Cache busting functionality has been disabled in the Rackspace next-gen driver and all of the OpenStack drivers. It's now only enabled in the Rackspace first-gen driver.

Cache busting functionality works by appending a random query parameter to every GET HTTP request. It was originally added to the Rackspace first-gen driver a long time ago to avoid excessive HTTP caching on the provider side. This excessive caching some times caused list\_nodes and other calls to return stale data.

This approach should not be needed with Rackspace next-gen and OpenStack drivers so it has been disabled.

No action is required on the user's side.

# libcloud.security.VERIFY\_SSL\_CERT\_STRICT variable has been removed

libcloud.security.VERIFY\_SSL\_CERT\_STRICT variable has been introduced in version 0.4.2 when we initially added support for SSL certificate verification. This variable was added to ease the migration from older versions of Libcloud which didn't verify SSL certificates.

In version 0.6.0, this variable has been set to True by default and deprecated.

In this release, this variable has been fully removed. For more information on how SSL certificate validation works in Libcloud, see the *SSL Certificate Validation* page.

## get\_container method changes in the S3 driver

Previously, the get\_container method in the S3 driver used a very inefficient approach of using list\_containers + late filterting.

The code was changed to use a more efficient approach which means using a single HTTP HEAD request.

The only downside of this approach is that it doesn't return container creation date.

If you need the container creation date, you should use list\_containers method and do the later filtering yourself.

### Libcloud 0.8

- restart\_node method has been removed from the OpenNebula compute driver, because OpenNebula OCCI implementation does not support a proper restart method.
- $\bullet$  ex\_save\_image method in the OpenStack driver now returns a NodeImage instance.

For a full list of changes, please see the CHANGES file.

### Libcloud 0.7

• For consistency, public\_ip and private\_ip attribute on the Node object have been renamed to public\_ips and private\_ips respectively.

In 0.7 you can still access those attributes using the old way, but this option will be removed in the next major release.

Note: If you have places in your code where you directly instantiate a "Node" class, you need to update it.

Old code:

#### Updated code:

• Old deprecated paths have been removed. If you still haven't updated your code you need to do it now, otherwise it won't work with 0.7 and future releases.

Below is a list of old paths and their new locations:

- libcloud.base -> libcloud.compute.base
- libcloud.deployment -> libcloud.compute.deployment
- libcloud.drivers.\* -> libcloud.compute.drivers.\*
- libcloud.ssh -> libcloud.compute.ssh
- libcloud.types -> libcloud.compute.types
- libcloud.providers -> libcloud.compute.providers

In the contrib/ directory you can also find a simple bash script which can perform a search and replace for you - migrate\_paths.py.

For a full list of changes, please see the CHANGES file.

#### Libcloud 0.6

• SSL certificate verification is now enabled by default and an exception is thrown if CA certificate files cannot be found.

To revert to the old behavior, set libcloud.security.VERIFY\_SSL\_CERT\_STRICT variable to False:

```
libcloud.security.VERIFY_SSL_CERT_STRICT = False
```

Note: You are strongly discouraged from disabling SSL certificate validation. If you disable it and no CA certificates files are found on the system you are vulnerable to a man-in-the-middle attack

More information on how to acquire and install CA certificate files on different operating systems can be found on SSL Certificate Validation page

• OpenStack driver now defaults to using OpenStack 1.1 API.

To preserve the old behavior and use OpenStack 1.0 API, pass api\_version='1.0' keyword argument to the driver constructor.

For example:

```
Cls = get_provider(Provider.OPENSTACK)
driver = Cls('user_name', 'api_key', False, 'host', 8774, api_version='1.0')
```

• OpenNebula driver now defaults to using OpenNebula 3.0 API

To preserve the old behavior and use OpenNebula 1.4 API, pass api\_version='1.4' keyword argument to the driver constructor.

For example:

```
Cls = get_provider(Provider.OPENNEBULA)
driver = Cls('key', 'secret', api_version='1.4')
```

For a full list of changes, please see the CHANGES file.

# 1.4.3 Security

## Reporting a vulnerability

**Note:** Please do **not** report security issues using our public Github instance. Use the private mailing list described below.

If you believe you've found a security issue or a vulnerability, please send a description of it to our private mailing list at security@libcloud.apache.org

You are also encouraged to encrypt this email using PGP. Keys of our developers can be found at https://www.apache.org/dist/libcloud/KEYS.

Once you've submitted an issue, you should receive an acknowledgment from one our of team members in 48 hours or less. If further action is necessary, you may receive additional follow-up emails.

### How are vulnerabilities handled?

We follow a standard Apache Software Foundation vulnerability handling process which is described at http://www.apache.org/security/committers.html#vulnerability-handling

**Note:** Unless noted otherwise, all of the examples and code snippets in the documentation are licensed under the Apache 2.0 license.
